## 17.36.2 Macro Definition Documentation

### 17.36.2.1 `__CM7_REV`

```
#define __CM7_REV 0x0000
```

Configuration of the Cortex-M7 Processor and Core Peripherals.

SAME70Q21 core revision number ([15:8] revision number, [7:0] patch number)

### 17.36.2.2 `__DCACHE_PRESENT`

```
#define __DCACHE_PRESENT 1
```

SAME70Q21 does provide a Data Cache

### 17.36.2.3 `__DTCM_PRESENT`

```
#define __DTCM_PRESENT 1
```

SAME70Q21 does provide a Data TCM

### 17.36.2.4 `__FPU_DP`

```
#define __FPU_DP 1
```

SAME70Q21 Double precision FPU

### 17.36.2.5 `__FPU_PRESENT`

```
#define __FPU_PRESENT 1
```

SAME70Q21 does provide a FPU

### 17.36.2.6 `__ICACHE_PRESENT`

```
#define __ICACHE_PRESENT 1
```

SAME70Q21 does provide an Instruction Cache

### 17.36.2.7 `__ITCM_PRESENT`

```
#define __ITCM_PRESENT 1
```

SAME70Q21 does provide an Instruction TCM

**17.36.2.8 \_\_MPU\_PRESENT**

```
#define __MPU_PRESENT 1
SAME70Q21 does provide a MPU
```

**17.36.2.9 \_\_NVIC\_PRIO\_BITS**

```
#define __NVIC_PRIO_BITS 3
SAME70Q21 uses 3 Bits for the Priority Levels
```

**17.36.2.10 \_\_Vendor\_SysTickConfig**

```
#define __Vendor_SysTickConfig 0
Set to 1 if different SysTick Config is used
```

**17.36.3 Enumeration Type Documentation****17.36.3.1 IRQn**

enum [IRQn](#)  
Interrupt Number Definitions.

**Enumerator**

|                       |                                                      |

### 17.38.2 Macro Definition Documentation

#### 17.38.2.1 CONF\_MCAN\_ELEMENT\_DATA\_SIZE

```
#define CONF_MCAN_ELEMENT_DATA_SIZE 8
```

The value should be 8/12/16/20/24/32/48/64.

#### 17.38.2.2 CONF\_MCAN\_FBTP\_FBRP\_VALUE

```
#define CONF_MCAN_FBTP_FBRP_VALUE 5
```

Data bit Baud Rate Prescaler

#### 17.38.2.3 CONF\_MCAN\_FBTP\_FSJW\_VALUE

```
#define CONF_MCAN_FBTP_FSJW_VALUE 3
```

Data bit (Re)Synchronization Jump Width

**17.38.2.4 CONF\_MCAN\_FBTP\_FTSEG1\_VALUE**

```
#define CONF_MCAN_FBTP_FTSEG1_VALUE 10
Data bit Time segment before sample point
```

**17.38.2.5 CONF\_MCAN\_FBTP\_FTSEG2\_VALUE**

```
#define CONF_MCAN_FBTP_FTSEG2_VALUE 3
Data bit Time segment after sample point
```

**17.38.2.6 CONF\_MCAN\_NBTP\_NBRP\_VALUE**

```
#define CONF_MCAN_NBTP_NBRP_VALUE 2
```

The setting of the nominal bit rate is based on the PCK5 which is 30M which you can change in the conf\_clock.h. Below is the default configuration. The time quanta is  $30\text{MHz} / (2+1) = 10\text{MHz}$ . And each bit is  $(1 + \text{NTSEG1} + 1 + \text{NTSEG2} + 1) = 20$  time quanta which means the bit rate is  $10\text{MHz}/20=500\text{KHz}$ . Nominal bit Baud Rate Prescaler

**17.38.2.7 CONF\_MCAN\_NBTP\_NSJW\_VALUE**

```
#define CONF_MCAN_NBTP_NSJW_VALUE 3
Nominal bit (Re)Synchronization Jump Width
```

**17.38.2.8 CONF\_MCAN\_NBTP\_NTSEG1\_VALUE**

```
#define CONF_MCAN_NBTP_NTSEG1_VALUE 10
Nominal bit Time segment before sample point
```

**17.38.2.9 CONF\_MCAN\_NBTP\_NTSEG2\_VALUE**

```
#define CONF_MCAN_NBTP_NTSEG2_VALUE 7
Nominal bit Time segment after sample point
```

**17.39 conf\_mcan.h**

## 17.58 system\_same70.h File Reference

```
#include <stdint.h>
```

### Functions

- void **SystemInit** (void)  
*Setup the microcontroller system. Initialize the System and update the SystemCoreClock variable.*
- void **SystemCoreClockUpdate** (void)  
*Updates the SystemCoreClock with current core Clock retrieved from cpu registers.*
- void **system\_init\_flash** (uint32\_t dw\_clk)

### Variables

- uint32\_t **SystemCoreClock**

### 17.58.1 Detailed Description

### 17.58.2 Function Documentation

#### 17.58.2.1 system\_init\_flash()

```
void system_init_flash (
 uint32_t dw_clk)
```

Initialize flash.

### 17.58.3 Variable Documentation

#### 17.58.3.1 SystemCoreClock

```
uint32_t SystemCoreClock [extern]
INDENT-OFF INDENT-ON
```

00024 // Start of Flash memory base address
00025 #define FS_FLASHBASE (0xC0000000)
00026
00027 /*
00028 * BLOCKSIZE
00029 * This defines the size of the blocks to be used in the file storage area.
00030 * This must be an erasable unit of the flash chip. All blocks in the file
00031 * storage area must be the same size. This maybe different from the DESCIZE
00032 * where the flash chip has different size erasable units available.
00033 *
00034 * SECTORSIZE
00035 * This defines the sector size. Each block is divided into a number of sectors.
00036 * This number is the smallest usable unit in the system and thus represents the
00037 * minimum file storage area. For best usage of the flash blocks the sector size
00038 * should always be a power of 2. For more information see sector section below.
00039 *
00040 * SECTORPERBLOCK
00041 * This defines the number of sectors in a block. It must always be true that:
00042 * SECTORPERBLOCK = BLOCKSIZE/SECTORSIZE
00043 *
00044 *
00045 * The memory map below is for a MOD5441x with a 32MB bottom boot block flash.
00046 * This example will allocate 1.3MB for the file system.
00047 * - 2 blocks are reserved for the file descriptors
00048 * - 1 block is reserved as a free sector for the file system to operate
00049 *
00050 * A total of 10 blocks are allocated for the file system. Subtracting the 3 reserved
00051 * as described above, the total file system free space is: 7 * 128k = 896k (917,504 bytes).
00052 *
00053 * Macronix MX29GL256F, 256 blocks of 128KB each, Total of 32MBytes

## 17.85.2 Macro Definition Documentation

### 17.85.2.1 `_L_`

```
#define _L_(
 x) x ## L
```

C code: Long integer literal constant value

### 17.85.2.2 `_U_`

```
#define _U_(
 x) x ## U
```

C code: Unsigned integer literal constant value

### 17.85.2.3 `_UL_`

```
#define _UL_(
 x) x ## UL
```

C code: Unsigned Long integer literal constant value

### 17.85.2.4 `AXIMX_ADDR`

```
#define AXIMX_ADDR (0xA0000000u)
```

AXI Bus Matrix base address

### 17.85.2.5 `DTCM_ADDR`

```
#define DTCM_ADDR (0x20000000u)
```

Data Tightly Coupled Memory base address

### 17.85.2.6 `EBI_CS0_ADDR`

```
#define EBI_CS0_ADDR (0x60000000u)
```

EBI Chip Select 0 base address

### 17.85.2.7 `EBI_CS1_ADDR`

```
#define EBI_CS1_ADDR (0x61000000u)
```

EBI Chip Select 1 base address

### 17.85.2.8 `EBI_CS2_ADDR`

```
#define EBI_CS2_ADDR (0x62000000u)
```

EBI Chip Select 2 base address

### 17.85.2.9 `EBI_CS3_ADDR`

```
#define EBI_CS3_ADDR (0x63000000u)
```

EBI Chip Select 3 base address

### 17.85.2.10 IFLASH\_ADDR

```
#define IFLASH_ADDR (0x00400000u)
Internal Flash base address
```

### 17.85.2.11 IRAM\_ADDR

```
#define IRAM_ADDR (0x20400000u)
Internal RAM base address
```

### 17.85.2.12 IROM\_ADDR

```
#define IROM_ADDR (0x00800000u)
Internal ROM base address
```

### 17.85.2.13 ITCM\_ADDR

```
#define ITCM_ADDR (0x00000000u)
Instruction Tightly Coupled Memory base address
```

### 17.85.2.14 QSPIMEM\_ADDR

```
#define QSPIMEM_ADDR (0x80000000u)
QSPI Memory base address
```

### 17.85.2.15 SDRAM\_CS\_ADDR

```
#define SDRAM_CS_ADDR (0x70000000u)
SDRAM Chip Select base address
```

## 17.85.3 Typedef Documentation

### 17.85.3.1 RoReg

```
typedef volatile const uint32_t RoReg
Read only 32-bit register (volatile const unsigned int)
```

### 17.85.3.2 RoReg16

```
typedef volatile const uint16_t RoReg16
Read only 16-bit register (volatile const unsigned int)
```

### 17.85.3.3 RoReg8

```
typedef volatile const uint8_t RoReg8
Read only 8-bit register (volatile const unsigned int)
```

### 17.85.3.4 RwReg

```
typedef volatile uint32_t RwReg
Read-Write 32-bit register (volatile unsigned int)
```

### 17.85.3.5 RwReg16

```
typedef volatile uint16_t RwReg16
Read-Write 16-bit register (volatile unsigned int)
```

### 17.85.3.6 RwReg8

```
typedef volatile uint8_t RwReg8
Read-Write 8-bit register (volatile unsigned int)
```

### 17.85.3.7 WoReg

```
typedef volatile uint32_t WoReg
```

Write only 32-bit register (volatile unsigned int)

### 17.85.3.8 WoReg16

```
typedef volatile uint16_t WoReg16
```

Write only 16-bit register (volatile unsigned int)

### 17.85.3.9 WoReg8

```
typedef volatile uint32_t WoReg8
```

Write only 8-bit register (volatile unsigned int)

00024
00025 /*

```

```

00026 * BLOCKSIZE
00027 * This defines the size of the blocks to be used in the file storage area.
00028 * This must be an erasable unit of the flash chip. All blocks in the file
00029 * storage area must be the same size. This maybe different from the DESC_SIZE
00030 * where the flash chip has different size erasable units available.
00031 *
00032 * SECTORSIZE
00033 * This defines the sector size. Each block is divided into a number of sectors.
00034 * This number is the smallest usable unit in the system and thus represents the
00035 * minimum file storage area. For best usage of the flash blocks the sector size
00036 * should always be a power of 2. For more information see sector section below.
00037 *
00038 * SECTORPERBLOCK
00039 * This defines the number of sectors in a block. It must always be true that:
00040 * SECTORPERBLOCK = BLOCKSIZE/SECTORSIZE
00041 *
00042 *
00043 * The memory map below is for a MODM7AE70 with a 2MB bottom boot block flash.
00044 * This example will allocate 1.5MB for the application space, and 512KB for
00045 * the file system.
00046 *
00047 * Microchip SAME70Q21:
00048 * The memory is organized in sectors. Each sector has a size of 128KB. The
00049 * first sector is divided into 3 smaller sectors. The three smaller sectors are
00050 * organized in 2 sectors of 8KB and 1 sector of 112KB.
00051 * Total number of bytes for storage: 2,097,152. Application space: 1.97MB max.
00052 *
00053 * Address
00054 * -----
00055 * ----- 005F FFFF (End of flash space)
00056 * | File System Data |
00057 * | 256KB |
00058 * | 128K x 2 Blocks |
00059 * |-----| 005C 0000 (Start of File System Data)
00060 * | DESC BLOCK 0/1 |
00061 * | 128K x 2 Blocks |
00062 * |-----| 0058 0000 (Start of File System)
00063 * |
00064 * | Application |
00065 * | 1.375MB |
00066 * | 128K x 11 Blocks |
00067 * |
00068 * |-----| 0040 6004
00069 * | 8K User Params |
00070 * |-----| 0040 4000
00071 * | 10K Configuration |
00072 * |-----| 0040 1800
00073 * | 6K Monitor |
00074 * |-----| 0040 0000 (Start of Flash space)
00075 *
00076 *
00077 * DISABLING BACKGROUND ERASE
00078 * To use the EFFS-STD file system on the MODM7AE70 and SBE70LC, you must enable the feature:
00079 * "Locate Application at Fixed Address in Flash". This disables the background flash erase
00080 * feature, would will erase the flash file system sectors.
00081 *
00082 * If using NBEclipse:
00083 * - Right-click on the project and select "Properties"
00084 * - Navigate to C/C++ Build > Settings > NB Flashpack > General
00085 * - Check the checkbox for "Locate Application at Fixed Address in Flash"
00086 *
00087 * If you used the NBEclipse import example in the project creation, the StdFFFile.a library will
00088 * be included automatically. Otherwise, the library must be added manually.
00089 * - Navigate to C/C++ Build > Settings > GNC C/C++ Linker > Libraries
00090 * - In the Libraries section, add "StdFFFile"

00100 *
00101 * CHANGES TO COMPCODE FLAGS
00102 * In NBEclipse, or your command line makefile, change the following line
00103 * so the application will only occupy the specified application space.
00104 * The first parameter is the start of application space, and the second
00105 * is the address just below the file system space.
00106 *
00107 * COMPCODEFLAGS = 0x00406004 0x00580000
00108 *
00109 * If using NBEclipse:
00110 * - Right-click on the project and select "Properties"
00111 * - Select "NetBurner" in the left side of the dialog box
00112 * - Verify the Platform is set to Mod5234, then check the "Use Custom Platform Settings" checkbox
00113 * - Modify the "Compcode Memory Range" to the above values
00114 *
00115 *
00116 * If using NBEclipse, you will also need to tell the linker to include the
00117 * /nburn/platform/<platform>/original/lib/libStdFFile.a library. To do this right-click on your
00118 * project, select properties, GNU Linker, then add the library.
00119 *

## 17.112 JSON/DemoNetBurner/src/drawimage.cpp File Reference

Function definitions for the DrawImageObject class.

```
#include <iosys.h>
#include <malloc.h>
#include <string.h>
#include "drawimage.h"
#include "gifCompress.h"
```

### Functions

- void [FlushData](#) (int fd)
- void [WriteData](#) (int fd, const char \*c, int siz)
- void [OutputGifChar](#) (const char c, int fd)
- void [WriteOneChar](#) (const FontData \*pf, char c, int xp, int yp, uint8\_t color, DrawImageObject &doi)

### 17.112.1 Detailed Description

Function definitions for the DrawImageObject class.

This class hold the data associated with and draws GIF images with text to a given file descriptor

### 17.112.2 Function Documentation

#### 17.112.2.1 FlushData()

```
void FlushData (
 int fd)
```

FlushData

Flush any unwritten data to the output

#### 17.112.2.2 OutputGifChar()

```
void OutputGifChar (
 const char c,
 int fd)
```

OutputGifChar

Writes a GIF char to the given fd

#### 17.112.2.3 WriteData()

```
void WriteData (
 int fd,
 const char * c,
 int siz)
```

WriteData

This is the function that writes data to the output socket

#### 17.112.2.4 WriteOneChar()

```
void WriteOneChar (
 const FontData * pf,
 char c,
 int xp,
 int yp,
```

```

 uint8_t color,
 DrawImageObject & doi)

```

WriteOneChar

Writes a single character

## 17.113 Web/GifCanvas/src/drawimage.cpp File Reference

Function definitions for the DrawImageObject class.

```

- void [OutputGifChar](#) (const char c, int fd)
- void [WriteOneChar](#) (const FontData \*pf, char c, int xp, int yp, uint8\_t color, DrawImageObject &doi)

### 17.113.1 Detailed Description

Function definitions for the DrawImageObject class.

This class hold the data associated with and draws GIF images with text to a given file descriptor

### 17.113.2 Function Documentation

#### 17.113.2.1 FlushData()

```

void FlushData (
 int fd)

```

FlushData

Flush any unwritten data to the output

#### 17.113.2.2 OutputGifChar()

```

void OutputGifChar (
 const char c,
 int fd)

```

OutputGifChar

Writes a GIF char to the given fd

#### 17.113.2.3 WriteData()

```

void WriteData (
 int fd,
 const char * c,
 int siz)

```

WriteData

This is the function that writes data to the output socket

#### 17.113.2.4 WriteOneChar()

```

void WriteOneChar (
 const FontData * pf,
 char c,

```

```

 int xp,
 int yp,
 uint8_t color,
 DrawImageObject & doi)

```

### WriteOneChar

Writes a single character

00020 * Software Corporation disclaims all warranties, either express or implied,
00021 * including but not limited to implied warranties of merchantability and
00022 * fitness for a particular purpose, with respect to this code and accompanying
00023 * documentation.
00024 *
00025 * The miGIF compression routines do not, strictly speaking, generate files
00026 * conforming to the GIF spec, since the image data is not LZW-compressed
00027 * (this is the point: in order to avoid transgression of the Unisys patent
00028 * on the LZW algorithm.) However, miGIF generates data streams that any
00029 * reasonably sane LZW decompressor will decompress to what we want.
00030 *
00031 * miGIF compression uses run length encoding. It compresses horizontal runs
00032 * of pixels of the same color. This type of compression gives good results
00033 * on images with many runs, for example images with lines, text and solid
00034 * shapes on a solid-colored background. It gives little or no compression
00035 * on images with few runs, for example digital or scanned photos.

This code module contains the web functions for the POP3 mail using SSL example program.

```

#include <crypto/ssl_pop3.h>
#include <dns.h>
#include <effs_fat/fat.h>
#include <httppost.h>
#include <mailto.h>
#include <netinterface.h>
#include <stdlib.h>
#include "FileSystemUtils.h"
#include "cardtype.h"

```

### Functions

- void [WebDisplayDhcpSelect](#) (int sock, PCSTR url)  
*Displays if the network values are statically set or assigned by [DHCP](#).*
- void [WebShowDhcpDeviceIpAddress](#) (int sock, PCSTR url)  
*Displays the active IP value.*
- void [WebShowStaticDeviceIpAddress](#) (int sock, PCSTR url)  
*Displays the static IP value.*

- void [WebShowDhcpDeviceIpMask](#) (int sock, PCSTR url)  
*Displays the active IP mask value.*
- void [WebShowStaticDeviceIpMask](#) (int sock, PCSTR url)  
*Displays the static IP mask value.*
- void [WebShowDhcpDeviceGateway](#) (int sock, PCSTR url)  
*Displays the active gateway value.*
- void [WebShowStaticDeviceGateway](#) (int sock, PCSTR url)  
*Displays the static gateway value.*
- void [WebShowDhcpDeviceDnsServer](#) (int sock, PCSTR url)  
*Displays the active DNS server value.*
- void [WebShowStaticDeviceDnsServer](#) (int sock, PCSTR url)  
*Displays the static DNS server value.*
- void [WebShowDeviceName](#) (int sock, PCSTR url)  
*Displays the device's name form value.*
- void [WebShowUserValue](#) (int sock, PCSTR url)  
*Displays the current username form value.*
- void [WebShowUserPass](#) (int sock, PCSTR url)  
*Displays the current user password form value.*
- void [WebShowServer](#) (int sock, PCSTR url)  
*Displays the current destination server form value.*
- void [LastResult](#) (int sock, PCSTR url)  
*Displays the results of the request and any associated information with the request. If email messages were successfully returned, then links to those pages will be added to the page.*
- void [POP3\\_GetMessages](#) (int session)  
*POP3\_GetMessages.*
- void [HandleGetMailPost](#) (int sock, PostEvents event, const char \*pName, const char \*pValue)  
*Handles the post for the get mail post request. This callback is called for each field of a post form.*
- int [HandleMailGet](#) (int sock, [HTTP\\_Request](#) &pr)  
*A GET callback function that displays the email saved on the file system in the browser.*

## 17.202.1 Detailed Description

This code module contains the web functions for the POP3 mail using SSL example program.

## 17.202.2 Function Documentation

### 17.202.2.1 HandleGetMailPost()

```
void HandleGetMailPost (
 int sock,
 PostEvents event,
 const char * pName,
 const char * pValue)
```

Handles the post for the get mail post request. This callback is called for each field of a post form.

#### Parameters

|               |                                                                            |
|---------------|----------------------------------------------------------------------------|
| <i>sock</i>   | HTTP socket.                                                               |
| <i>event</i>  | The kind of post event that is currently being handled with this callback. |
| <i>pName</i>  | The name of the post element that is currently being handled.              |
| <i>pValue</i> | The value of the post element that is currently being handled.             |

**17.202.2.2 HandleMailGet()**

```
int HandleMailGet (
 int sock,
 HTTP_Request & pr)
```

A GET callback function that displays the email saved on the file system in the browser.

**Parameters**

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>sock</i> | HTTP socket.                                         |
| <i>pr</i>   | The HTTP request object associated with the request. |

**Return values**

|    |                                                 |
|----|-------------------------------------------------|
| 0  | If the file was found and sent.                 |
| -1 | If the file was not found or unable to be sent. |

**17.202.2.3 LastResult()**

```
void LastResult (
 int sock,
 PCSTR url)
```

Displays the results of the request and any associated information with the request. If email messages were successfully returned, then links to those pages will be added to the page.

**Parameters**

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.4 POP3\_GetMessages()**

```
void POP3_GetMessages (
 int session)
```

POP3\_GetMessages.

**Parameters**

|                |                                                    |
|----------------|----------------------------------------------------|
| <i>session</i> | The session number associated with the connection. |
|----------------|----------------------------------------------------|

**17.202.2.5 WebDisplayDhcpSelect()**

```
void WebDisplayDhcpSelect (
 int sock,
 PCSTR url)
```

Displays if the network values are statically set or assigned by **DHCP**.

**Parameters**

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

### 17.202.2.6 WebShowDeviceName()

```
void WebShowDeviceName (
 int sock,
 PCSTR url)
```

Displays the device's name form value.

#### Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

### 17.202.2.7 WebShowDhcpDeviceDnsServer()

```
void WebShowDhcpDeviceDnsServer (
 int sock,
 PCSTR url)
```

Displays the active DNS server value.

#### Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

### 17.202.2.8 WebShowDhcpDeviceGateway()

```
void WebShowDhcpDeviceGateway (
 int sock,
 PCSTR url)
```

Displays the active gateway value.

#### Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

### 17.202.2.9 WebShowDhcpDeviceIpAddress()

```
void WebShowDhcpDeviceIpAddress (
 int sock,
 PCSTR url)
```

Displays the active IP value.

#### Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

### 17.202.2.10 WebShowDhcpDeviceIpMask()

```
void WebShowDhcpDeviceIpMask (
 int sock,
 PCSTR url)
```

Displays the active IP mask value.

## Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.11 WebShowServer()**

```
void WebShowServer (
 int sock,
 PCSTR url)
```

Displays the current destination server form value.

## Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.12 WebShowStaticDeviceDnsServer()**

```
void WebShowStaticDeviceDnsServer (
 int sock,
 PCSTR url)
```

Displays the static DNS server value.

## Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.13 WebShowStaticDeviceGateway()**

```
void WebShowStaticDeviceGateway (
 int sock,
 PCSTR url)
```

Displays the static gateway value.

## Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.14 WebShowStaticDeviceIpAddress()**

```
void WebShowStaticDeviceIpAddress (
 int sock,
 PCSTR url)
```

Displays the static IP value.

## Parameters

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.15 WebShowStaticDeviceIpMask()**

```
void WebShowStaticDeviceIpMask (
 int sock,
 PCSTR url)
```

Displays the static IP mask value.

**Parameters**

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.16 WebShowUserPass()**

```
void WebShowUserPass (
 int sock,
 PCSTR url)
```

Displays the current user password form value.

**Parameters**

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

**17.202.2.17 WebShowUserValue()**

```
void WebShowUserValue (
 int sock,
 PCSTR url)
```

Displays the current username form value.

**Parameters**

|             |              |
|-------------|--------------|
| <i>sock</i> | HTTP Socket  |
| <i>url</i>  | Calling page |

- void [WebDestPort](#) (int sock, PCSTR url)
- void [WebDestIp](#) (int sock, PCSTR url)
- void [CheckNVSettings](#) ()

### 17.234.1 Detailed Description

This module handles the web page interface to the UDP to Serial program example.

## 17.234.2 Function Documentation

### 17.234.2.1 CheckNVSettings()

```
void CheckNVSettings ()
```

Check NV Settings. This function will check the flash memory user parameter storage area for valid stored values. If the values are invalid (VerifyKey), it will assign default values.

### 17.234.2.2 WebDestIp()

```
void WebDestIp (
 int sock,
 PCSTR url)
```

Function to display current destination IP address

### 17.234.2.3 WebDestPort()

```
void WebDestPort (
 int sock,
 PCSTR url)
```

Function to display destination port number

### 17.234.2.4 WebLocalPort()

```
void WebLocalPort (
 int sock,
 PCSTR url)
```

Function to display destination port number

```

### Classes

- struct [CertGenData](#)

*Used to store the information that is passed in when enabling onboard generated certificates, as well as the information needed to determine when they need to be regenerated.*

- class [CertData](#)

### Enumerations

- enum [SslKeyType\\_t](#) {  
[SSL\\_KEY\\_NONE](#) = 0 , [SSL\\_KEY\\_RSA\\_1024](#) = 1 , [SSL\\_KEY\\_RSA\\_2048](#) , [SSL\\_KEY\\_RSA\\_4096](#) ,  
[SSL\\_KEY\\_ECC\\_SECP192R1](#) = [ECC\\_SECP192R1](#) , [SSL\\_KEY\\_ECC\\_SECP224R1](#) = [ECC\\_SECP224R1](#) ,

```
SSL_KEY_ECC_SECP256R1 = ECC_SECP256R1 , SSL_KEY_ECC_SECP384R1 = ECC_SECP384R1 ,
SSL_KEY_ECC_SECP521R1 = ECC_SECP521R1 }
```

*Certificate Generation Key Types.*

- enum `AltNameType_t` : char { `ALT_NAME_TYPE_NONE` = 0 , `ALT_NAME_TYPE_DNS` = (char)0x82 , `ALT_NAME_TYPE_IP` = (char)0x87 }

*Certificate Generation Alternate Name Types.*

- enum `CertGenReturnCode` : int { `CERT_GEN_RETURN_SUCCESS` = 1 , `CERT_GEN_RETURN_NOT_REQUIRED` = 2 , `CERT_GEN_RETURN_INVALID_RANGE` = -1 , `CERT_GEN_RETURN_MALLOC_ERROR` = -2 , `CERT_GEN_RETURN_ECC_INIT_ERROR` = -3 , `CERT_GEN_RETURN_ECC_CREATE_ERROR` = -4 , `CERT_GEN_RETURN_RSA_INIT_ERROR` = -5 , `CERT_GEN_RETURN_RSA_CREATE_ERROR` = -6 , `CERT_GEN_RETURN_CERT_INIT_ERROR` = -7 , `CERT_GEN_RETURN_CERT_CREATE_ERROR` = -8 , `CERT_GEN_RETURN_CERT_SIGNING_ERROR` = -9 , `CERT_GEN_RETURN_CERT_SAVING_ERROR` = -10 , `CERT_GEN_RETURN_KEY_CONVERT_ERROR` = -11 , `CERT_GEN_RETURN_KEY_SAVING_ERROR` = -12 , `CERT_GEN_RETURN_SET_ISSUER_ERROR` = -13 }

*Certificate Generation Function Return Codes.*

## Functions

- `CertGenReturnCode` `SSL_CreateNewSelfSignedCert` (`CertGenData` &`pGenData`)  
*Generates a new self-signed certificate that will be stored on the device.*
- void `EnableOnboardCertificateCreation` (`CertGenReturnCode`(\*`createCertFunc`)(`CertGenData` &`cGenData`)=`SSL_CreateNewSelfSignedCert`)  
*Enables the ability for the module to automatically generate self-signed certificates for use in SSL/TLS connections when acting as the server.*
- void `FillInAltNamesASN1` (`Cert` &`TheCert`, `NBString` &`altNameString`)  
*Helper function used to build ASN1 representation of alt names.*
- `CertGenReturnCode` `CheckAndCreateHalCertAndKey` ()  
*Check for a valid SSL certificate and generate one if not found.*
- `CertGenData` \* `GetDataForCertGen` ()  
*A function to be overridden to pass certificate details to the certificate generator.*

### 17.241.1 Detailed Description

Onboard Self-Signed Certificate Generation.

## 17.263 ssl.h File Reference

### NetBurner SSL/TLS API.

```

#include <nettypes.h>
#include <predef.h>
#include <nbrtos.h>
#include <tcp.h>
#include <crypto/wolfssl/ssl.h>
#include <crypto/wolfssl/error-ssl.h>
#include <random.h>

```

### Macros

- #define **SSL\_ERROR\_FAILED\_NEGOTIATION** (-256)  
*The SSL system failed to successfully negotiate a connection.*
- #define **SSL\_ERROR\_CERTIFICATE\_UNKNOWN** (-258)  
*The received certificate could not be decoded.*
- #define **SSL\_ERROR\_CERTIFICATE\_NAME\_FAILED** (-260)

- The connected name did not match common\_name.*

  - #define **SSL\_ERROR\_CERTIFICATE\_VERIFY\_FAILED** (-261)  
*The server returned a certificate that we did not trust.*
  - #define **SSL\_ERROR\_NO\_BUFFER** (-262)  
*Unable to get a buffer from the pool.*
  - #define **SSL\_ERROR\_HANDSHAKE\_INCOMPLETE** (-265)  
*The SSL handshake is not complete yet.*
  - #define **SSL\_ERROR\_NO\_SERVER\_CERTIFICATE** (-257)  
*The server wasn't able to load the certificate.*
  - #define **SSL\_ERROR\_NO\_SERVER\_KEY** (-258)  
*The server wasn't able to load the key.*
  - #define **SSL\_ERROR\_UNABLE\_TO\_LOAD\_CIPHERS** (-259)  
*The client was unable to load the cipher list.*
  - #define **SSL\_ERROR\_CERTIFICATE\_CHECK** (-260)  
*The server was unable to check the certificate.*

## Enumerations

- enum class **ExpireRetCodes** : unsigned char { **ExpireRetCodes::E\_CERT\_VALID** = 0 , **ExpireRetCodes::E\_CERT\_EXPIRED** = 1 , **ExpireRetCodes::E\_BAD\_EXPIRATION\_VALUE** = 2 , **ExpireRetCodes::E\_NO\_SYSTEM\_TIME** = 3 }  
*Return values for [SSL\\_IsCertExpired\(\)](#).*

## Functions

- int **SSL\_connect** (IPADDR ip, uint16\_t remotePort, uint32\_t timeout, const char \*commonName, bool verify↔ Peer=false, bool waitForNegotiation=true, const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM, int intf=-1)  
*SSL mirror of the TCP::connect() call.*
- int **SSL\_connect** (IPADDR ip, uint16\_t localPort, uint16\_t remotePort, uint32\_t timeout, const char \*commonName, bool verifyPeer=false, bool waitForNegotiation=true, const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM, int intf=-1)  
*Old version of SSL\_Connect with local port.*
- int **SSL\_makeSecure** (int tcpFd, const char \*commonName, bool verifyPeer=false, bool waitFor↔ Negotiation=true, const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuff↔ Format=SSL\_FILETYPE\_PEM, bool blsClient=true, uint32\_t timeout=**WAIT\_FOREVER**)  
*SSL mirror of the TCP::connect() call, but uses an existing TCP file descriptor.*
- int **SSL\_negotiate** (int tcpFd, const char \*common\_name, bool reuseSessionPort=true, bool verifyPeer=false, const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_↔ PEM, bool blsClient=true)  
*Executes the TLS negotiation over a given socket, to establish a secure communication channel through that socket.*
- int **SSLReadWithTimeout** (int fd, char \*cp, int size, uint32\_t timeout)  
*SSL mirror of the ReadWithTimeout() function.*
- uint32\_t **SetMaxSessionReuseTime** (uint32\_t newLifetimeTicks)  
*Allows one to specify at runtime what the longest duration that an established session can be used for before new connections must be fully renegotiated.*
- bool **IsSSL\_CertNKeyValid** (const char \*keyPEM, ssize\_t keylen, const char \*certPEM, ssize\_t certlen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Validate candidate certificate and private key.*
- bool **SSL\_AddCertToClientCaList** (const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Attempts to add a cert to the Certificate Authority List to the client SSL context.*
- bool **SSL\_AddCertToServerCaList** (const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Attempts to add a cert to the Certificate Authority List to the client SSL context.*

- bool [SSL\\_ClearClientCaList](#) ()  
*Clears certs that have been added to the client's Certificate Authority list.*
- bool [SSL\\_ClearServerCaList](#) ()  
*Clears certs that have been added to the server's Certificate Authority list.*
- uint16\_t [SSLGetRxBufferSizeUsed](#) (int fd)  
*Returns the amount of data buffered to be read from the socket.*
- uint16\_t [SSLGetTxBufferAvailSpace](#) (int fd)  
*Returns the amount of data buffered to be read from the socket.*
- void [SslInit](#) ()  
*This function initializes the SSL library.*
- void [SSL\\_DumpSSLSockets](#) ()  
*Prints the current state of all used sockets to stdout.*
- void [SSL\\_ClientReadyCert](#) (const unsigned char \*cert, const unsigned char \*key, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Add a key and certificate to the client.*
- void [SSL\\_ServerReadyCert](#) (const unsigned char \*cert, const unsigned char \*key, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Add a key and certificate to the server.*
- [ExpireRetCodes SSL\\_IsCertExpired](#) (unsigned char \*certBuff, int certLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns whether the given certificate has expired or not.*
- bool [SSL\\_GetIssuerFromCert](#) (unsigned char \*certBuff, int certLen, unsigned char \*issBuf, int issBufLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns the issuer from a certificate blob in the PEM format.*
- bool [SSL\\_GetSubjectNameFromCert](#) (unsigned char \*certBuff, int certLen, unsigned char \*subNamBuf, int subNamBufLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns the subject name from a certificate blob in the PEM format.*
- bool [SSL\\_GetAltNameFromCert](#) (unsigned char \*certBuff, int certLen, unsigned char \*altNamBuf, int altNamBufLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns an alternate name from a certificate blob in the PEM format.*
- bool [SSL\\_GetExpirationDate](#) (unsigned char \*certBuff, int certLen, unsigned char \*expBuf, int expBufLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns the expiration data of the certificate in question.*
- bool [SSL\\_GetTimeToExpire](#) (unsigned char \*certBuff, int certLen, uint16\_t certBuffFormat, time\_t &timeToExp)  
*Returns whether the given certificate has expired or not.*
- bool [SSL\\_GetCnFromCert](#) (unsigned char \*certBuff, int certLen, unsigned char \*comNamBuf, int comNamBufLen, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM)  
*Returns the common name from a certificate blob in the PEM format.*
- const char \* [GetCertificatePEM](#) ()  
*Function that returns a pointer to the compiled in server certificate.*
- int [GetCertificateLen](#) ()  
*Function that returns the length of the compiled in server certificate.*
- const char \* [GetPrivateKeyPEM](#) ()  
*Function that returns a pointer to the compiled in server key.*
- int [GetPrivateKeyLen](#) ()  
*Function that the length of the compiled in server key.*
- void [SslSetVerifyPeerClient](#) (bool verifyPeer)  
*Sets whether or not verify peer should be enabled on the global SSL client context.*
- void [SslSetVerifyPeerServer](#) (bool verifyPeer)  
*Sets whether or not verify peer should be enabled on the global SSL server context.*
- bool [SSL\\_IsCertAddedToClientCaList](#) ()

Checks to see if any certificates have been added to the global SSL client context.

- bool [SSL\\_IsCertAddedToServerCaList](#) ()

Checks to see if any certificates have been added to the global SSL server context.

### SSL socket option functions

- int [SSL\\_getsocketerror](#) (int fd)

Returns the socket error state for the specified SSL socket.

### SSL Server Functions

- BOOL(\* [IsSSLfd](#) )(int fd)

Returns whether or not a file descriptor is an SSL file descriptor.

- int(\* [SSL\\_GetRawSocket](#) )(int sslSocketFd)

Returns the TCP file descriptor associated with an SSL socket file descriptor.

- int(\* [SSL\\_setsockopt](#) )(int fd, int option)

Set SSL TCP socket options.

- int(\* [SSL\\_clrsockopt](#) )(int fd, int option)

Clear SSL TCP socket options.

- int(\* [SSL\\_getsockopt](#) )(int fd)

Returns the options for the specified SSL TCP socket.

- int [SSL\\_accept](#) (int fdListen, [IPADDR](#) \*address, uint16\_t \*port, uint16\_t timeout, bool waitFor↔ Negotiation=true, bool verifyPeer=false, const unsigned char \*certBuff=nullptr, uint32\_t certBuffSize=0, uint16\_t certBuffFormat=SSL\_FILETYPE\_PEM, const char \*commonName=nullptr)

This call is a mirror of the `TCP::accept()` call.

- [IPADDR](#) [SSL\\_GetSocketRemoteAddr](#) (int fd)

Returns the remote address of this connected socket.

- uint16\_t [SSL\\_GetSocketRemotePort](#) (int fd)

Returns the remote port of this connected socket.

- [IPADDR](#) [SSL\\_GetSocketLocalAddr](#) (int fd)

Returns the local address of this connected socket.

- uint16\_t [SSL\\_GetSocketLocalPort](#) (int fd)

Returns the local port of this connected socket.

- int [SSL\\_GetSocketInterface](#) (int fd)

Return the network interface associated with an SSL TCP socket.

- uint16\_t [SSL\\_GetTcpRtxCount](#) (int fd)

Return the current state of a SSL TCP socket.

- uint32\_t [SSL\\_TcpGetLastRxTime](#) (int fd)

SSL mirror of `TcpGetLastRxTime()`.

- uint32\_t [SSL\\_TcpGetLastRxInterval](#) (int fd)

SSL mirror of `TcpGetLastRxInterval()`.

- void [SSL\\_TcpSendKeepAlive](#) (int fd)

SSL mirror of `TcpSendKeepAlive()`.

- bool [SSLSocketsAvail](#) ()

Returns whether or not there are any sockets available.

- int [FreeSSLSockets](#) ()

Returns the number of currently free SSL sockets.

## 17.263.1 Detailed Description

NetBurner SSH API.

```

#include <nettypes.h>
#include <stdio.h>
#include <basictypes.h>
#include <ssh/wolfssh/ssh.h>
#include <ssh/NetBurner/UserAuthManager.h>
#include <ssh/NetBurner/SshSocket.h>

```

## Macros

- `#define SSH_SUCCESS (0)`

- The function completed successfully.*

  - #define **SSH\_ERROR\_FAILED\_SESSION\_FAILED** (-300)  
*Not currently used, kept for backward compatibility.*
  - #define **SSH\_ERROR\_FAILED\_NEGOTIATION** (-301)  
*The connection failed the SSH negotiation.*
  - #define **SSH\_ERROR\_FAILED\_INITIALIZATION** (-302)  
*The SSH system failed to initialize.*
  - #define **SSH\_ERROR\_FAILED\_CONTEXT\_INIT** (-303)  
*Unable to instantiate SSH client/server context.*
  - #define **SSH\_ERROR\_BAD\_KEY** (-304)  
*The key provided was invalid.*
  - #define **SSH\_ERROR\_BAD\_ARGUMENT** (-305)  
*A bad argument was provided to the function.*
  - #define **SSH\_FAILED\_KEY\_CHECK** (-306)  
*There were no keys designated to use for the SSH library, .*

### Typedefs

- typedef int(\* [sshUserAuthenticateFn](#)) (const char \*usernamePtr, const char \*passwordPtr)  
*[DEPRECATED] User provided SSH username and password authenticate routine for a server. Please consider [sshUserAuthenticateWithTypeFn](#).*
- typedef int(\* [sshUserAuthenticateWithTypeFn](#)) (const char \*usernamePtr, const char \*authValPtr, [AuthType](#) authType)  
*User provided SSH user authenticate routine for a server.*
- typedef int(\* [sshGetUserPwFn](#)) (const [NBString](#) &usernamePtr, [NBString](#) &passwordPtr)  
*User provided SSH user password authentication routine for clients.*
- typedef int(\* [sshGetUserKeyFn](#)) (const [NBString](#) &usernamePtr, [NBString](#) &publicKey, [NBString](#) &privateKey, [NBString](#) &keyType)  
*User provided SSH user key authenticate routine for clients.*
- typedef int(\* [sshUserGetKeyFn](#)) (int keyRequested, const unsigned char \*\*keyBufferPtr, int \*keyLengthPtr)  
*The user defined callback to get the server key used during the initial SSH negotiation.*

### Functions

- void [SshSetUserAuthenticate](#) ([sshUserAuthenticateFn](#) sshUserAuthenticateFnPtr)  
*[DEPRECATED] Sets the user defined server authentication function. Please consider [sshUserAuthenticateWithTypeFn](#).*
- [sshUserAuthenticateFn](#) [SshGetUserAuthenticate](#) (void)  
*[DEPRECATED] Gets the user defined server authentication function. Please consider [SshGetUserAuthenticateWithType](#).*
- void [SshSetUserAuthenticateWithType](#) ([sshUserAuthenticateWithTypeFn](#) sshUserAuthenticateFnPtr)  
*Sets the user defined server authentication function.*
- [sshUserAuthenticateWithTypeFn](#) [SshGetUserAuthenticateWithType](#) (void)  
*Gets the user defined server authentication function..*
- void [SshClientSetGetUserPaswordFn](#) ([sshGetUserPwFn](#) sshGetUserPwFnPtr)  
*Sets the user defined client authentication function for getting user passwords during SSH authentication.*
- [sshGetUserPwFn](#) [SshClientGetUserPaswordFn](#) (void)  
*Gets the user defined client authentication function for getting a user password during authentication.*
- void [SshClientSetGetUserKeyFn](#) ([sshGetUserKeyFn](#) sshGetUserKeyFnPtr)  
*Sets the user defined client authentication function for getting user keys during SSH authentication.*
- [sshGetUserKeyFn](#) [SshClientGetUserKeyFn](#) (void)  
*Gets the user defined client authentication function for getting a user key during authentication.*
- void [SshSetUserGetKey](#) ([sshUserGetKeyFn](#) sshUserGetKeyFnPtr)

- Sets the user defined callback method to provide the server key.*

  - [sshUserGetKeyFn SshGetUserGetKey](#) (void)

*Gets the user defined callback method to provide the server key.*

  - bool [SshValidateKey](#) (const char \*candidateKey, int candidateKeySize, int \*keyTypePtr, int keyFormat=WOLFSSH\_FORMAT\_ASN1)

*Takes a key and returns if it's valid or not.*

  - bool [SshWritePublicKey](#) (int publicKeyFd, unsigned char \*candidateKey, int candidateKeySize)

*Write public key to file descriptor. Takes both PEM and ANS1 formats.*

  - int [NbSshInit](#) ()

*Initializes the underlying SSH framework. This will start a background task used to handle negotiations and SSH traffic. This is automatically called by SshAccept and SshConnect, and doesn't need to be called directly except in special circumstances.*

  - int [SshAccept](#) (int listenFd, [IPADDR](#) \*clientAddress, uint16\_t \*securePort, uint16\_t timeout)

*Accepts and negotiates SSH session. Automatically calls [NbSshInit\(\)](#) if required.*

  - int [SshConnect](#) ([IPADDR](#) clientAddress, uint16\_t securePort, uint16\_t localPort, uint16\_t timeout, const char \*username)

*Issues a connect request to negotiates an SSH session. Automatically calls [NbSshInit\(\)](#) if required.*

  - SshSocket \* [SshNegotiateSession](#) (int fd)

*Negotiates an SSH server session on an open file descriptor.*

  - SshSocket \* [SshNegotiateSessionClient](#) (int secureFd, const char \*username)

*Negotiates an SSH client session on an open file descriptor.*

  - void [SshPrintStatistics](#) (int secureFd)

*Negotiates an SSH client session on an open file descriptor.*

  - int [SshGetKeySize](#) ()

*Determines and returns SSH's installed key size.*

  - int [SshSetBannerText](#) (const char \*banner)

*Sets the banner text displayed by the SSH server on connection.*

  - int [SshSetSockOption](#) (int fd, int option)

*Set SSH TCP socket options.*

  - int [SshClrSockOption](#) (int fd, int option)

*Clear SSH TCP socket options.*

  - int [SshGetSockOption](#) (int fd)

*Returns the options for the specified SSH TCP socket.*

## 17.272 UserAuthManager.h File Reference

NetBurner User Authorization Manager.

```

#include <predef.h>
#include <basictypes.h>
#include <nbstring.h>
#include <crypto/wolfssl/wolfcrypt/sha256.h>

```

### Classes

- struct [UserAuthRecord](#)

A stored record of a user's authorization credentials. The value is hashed when saved so it can't be read directly. User's can currently only have one authorization record per user name.

- class [UserAuthManager](#)

The user authorization manager class allows application developers the ability to manage user authorization records. The can be loaded and saved to any storage space, including the config system or UserParams. Authorization values are hashed before being saved. Validation compares both the hash as well as the authorization type. Adding, updating, and removing records will automatically call the user devined save functions. For usage, please see the example found in [examples/SSH/sshServerUserAuth](#).

### Typedefs

- typedef int(\* [SaveAuthRecordsFn](#)) (const [UserAuthRecord](#) \*authRec)

User provided function for saving user authorization records. This allows the users to dictate where their authorization records are stored.

- typedef int(\* [LoadAuthRecordsFn](#)) ([UserAuthRecord](#) \*authRec)

User provided function for loading user authorization records. This allows the users to dictate where their authorization records are stored.

### Enumerations

- enum [AuthType](#) : int8\_t { [eAuthTypeDefault](#) = 0 , [eAuthTypePassword](#) = 1 , [eAuthTypeKey](#) = 2 }

The types of authorization requests that are managed. These just indicate what the has value is, and don't provide any specific processing logic.

- enum [AuthResponse](#) : int16\_t { [eAuthSuccess](#) = 1 , [eAuthErrorUserExists](#) = -1 , [eAuthErrorUserDoesNotExist](#) = -2 , [eAuthErrorNoEmptyUserAuthRecords](#) = -3 , [eAuthErrorUnableToCreateHash](#) = -4 , [eAuthErrorAuthCheckFailed](#) = -5 , [eAuthErrorAuthTypeMismatch](#) = -6 , [eAuthErrorFailedRecordUpdate](#) = -7 , [eAuthErrorUnableToAddUser](#) = -8 , [eAuthErrorSaveFailed](#) = -9 }

Response return codes when checking for the authorization status of a user.

### 17.284.1 Detailed Description

Wifi Constants.

### 17.284.2 Enumeration Type Documentation

#### 17.284.2.1 BssType

enum `NB::Constants::BssType`

NBWIFI BssType Values.

Enumerator

|                                     |                                                                      |
|-------------------------------------|----------------------------------------------------------------------|
| <code>BssType_Infrastructure</code> | BSS Infrastructure mode.                                             |
| <code>BssType_AdHoc</code>          | BSS AdHoc mode.                                                      |
| <code>BssType_Any</code>            | BSS arbitrary, but chosen based as max n-bit number (in this case 6) |
| <code>BssType_Unknown</code>        | BSS unknown mode.                                                    |

#### 17.284.2.2 ConnectResult

enum `NB::Constants::ConnectResult`

NBWIFI ConnectResult Values.

Enumerator

|                              |                        |
|------------------------------|------------------------|
| <code>Connect_Success</code> | Connection successful. |
|------------------------------|------------------------|

## Enumerator

|                        |                        |
|------------------------|------------------------|
| Connect_BadPass        | Bad password.          |
| Connect_NoAPFound      | No access point found. |
| Connect_BSSID_NotFound | BSS ID not found.      |
| Connect_TimedOut       | Time out.              |

**17.284.2.3 RadioBand**

enum [NB::Constants::RadioBand](#)

NBWIFI RadioBand Values.

## Enumerator

|             |             |
|-------------|-------------|
| Band_All    | All Bands.  |
| Band_2_4GHz | 2.4GHz Band |
| Band_5GHz   | 5GHz Band   |

**17.284.2.4 ScanMethods**

enum [NB::Constants::ScanMethods](#)

NBWIFI ScanMethods Values.

## Enumerator

|              |               |
|--------------|---------------|
| Scan_Passive | Passive scan. |
| Scan_Active  | Active scan.  |

**17.284.2.5 TaskKillError**

enum [NB::Constants::TaskKillError](#)

NBWIFI TaskKillError Values.

## Enumerator

|                         |                          |
|-------------------------|--------------------------|
| TaskKill_Err_NoError    | No error has occurred.   |
| TaskKill_Err_NotRunning | Task is already running. |

**17.284.2.6 TaskStartError**

enum [NB::Constants::TaskStartError](#)

NBWIFI TaskStartError Values.

## Enumerator

|                             |                           |
|-----------------------------|---------------------------|
| TaskStart_Err_NoError       | No error has occurred.    |
| TaskStart_Err_Running       | Task is already running.  |
| TaskStart_Err_NotRegistered | Driver is not registered. |

### Functions

- nbWifiScanResult \* [WifiInitScan\\_SPI](#) (int irqNum=-1, int moduleNum=-1, int csNum=-1, int connectorNum=-1, int gpioPinNum=-1, int resetPinNum=-1)
 

*Initializes the WiFi hardware, initializes the driver over the SPI bus, and performs an AP scan.*
- int [WifiInitScanAndShow\\_SPI](#) (int irqNum=-1, int moduleNum=-1, int csNum=-1, int connectorNum=-1, int gpioPinNum=-1, int resetPinNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the SPI bus, performs an AP scan, and prints the scan results via serial output.*
- int [InitWifi\\_SPI](#) (const char \*SSID="", const char \*password="", int irqNum=-1, int moduleNum=-1, int csNum=-1, int connectorNum=-1, int gpioPinNum=-1, int resetPinNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the SPI bus, and attempts to establish the specified connection.*
- int [InitAP\\_SPI](#) (const char \*SSID="", const char \*password="", uint8\_t channel=NBWIFI\_DEFAULT\_WIFICHANNEL, int irqNum=-1, int moduleNum=-1, int csNum=-1, int connectorNum=-1, int gpioPinNum=-1, int resetPinNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the SPI bus, and attempts to establish the specified access point.*
- nbWifiScanResult \* [WifiInitScan\\_Serial](#) (int portNum=-1, int resetPinNum=-1, int connectorNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the UART interface, performs an AP scan, and prints the scan results via serial output.*
- int [WifiInitScanAndShow\\_Serial](#) (int portNum=-1, int resetPinNum=-1, int connectorNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the UART interface, performs an AP scan, and prints the scan results via serial output.*
- int [InitWifi\\_Serial](#) (const char \*SSID="", const char \*password="", int portNum=-1, int resetPinNum=-1, int connectorNum=-1)
 

*Initializes the WiFi hardware, initializes the driver using the UART interface, and attempts to establish the specified access point.*
- void [SetWifiSPISpeed](#) (int busSpeed)
 

*Set SPI bus speed.*
- void [ScanAndShowNetworks](#) ()
 

*Scan for surrounding access points and print the results via iprintf.*
- nbWifiScanResult \* [ScanForNetworks](#) ()
 

*Scan for surrounding access points.*

### Classes

- struct [NB::Wifi::driverStatusStruct](#)
- struct [wifi\\_init](#)

### Functions

- void [SetWifiSPISpeed](#) (int busSpeed)  
*Set SPI bus speed.*

- void [NB::PrintScanResult](#) (nbWifiScanResult \*scanResult)  
*Print the results of one scan result using iprintf.*
- [ParsedJsonDataSet NB::ConvertScanResultsToJSON](#) (nbWifiScanResult \*scanResults)  
*Convert the WiFi scan results into a JSON Object.*

### 17.292.1 Detailed Description

NetBurner Wifi API.

### 17.292.2 Function Documentation

#### 17.292.2.1 ConvertScanResultsToJSON()

```
ParsedJsonDataSet NB::ConvertScanResultsToJSON (
 nbWifiScanResult * scanResults)
```

Convert the WiFi scan results into a JSON Object.

##### Parameters

|    |                    |                                                                                 |
|----|--------------------|---------------------------------------------------------------------------------|
| in | <i>scanResults</i> | Pointer to the scan result structure containing the scan result to be converted |
|----|--------------------|---------------------------------------------------------------------------------|

##### Returns

[ParsedJsonDataSet](#) with the scan results if 'scanResults' is not empty. Otherwise, returns an empty [ParsedJsonDataSet](#).

#### 17.292.2.2 PrintScanResult()

```
void NB::PrintScanResult (
 nbWifiScanResult * scanResult)
```

Print the results of one scan result using iprintf.

##### Parameters

|    |                   |                                                                               |
|----|-------------------|-------------------------------------------------------------------------------|
| in | <i>scanResult</i> | Pointer to the scan result structure containing the scan result to be printed |
|----|-------------------|-------------------------------------------------------------------------------|

## 17.297 arp.h File Reference

ARP.

```

#include <buffers.h>
#include <nettypes.h>
#include <stdio.h>

```

### Functions

- void [ShowArp](#) ()  
*Display ARP cache, output will be the stdio serial port.*
- void [fShowArp](#) (FILE \*fp)  
*Display ARP cache, output will be sent to the specified file pointer.*
- BOOL [GetArpMacFromIp](#) (IPADDR4 ip, MACADR &ma)

Check to see if the specified IP address is in the ARP cache.

- void `sendGratuitousArp` (int interfaceNumber, `IPADDR4` ip)

Send Gratuitous ARP Request.

## 17.297.1 Detailed Description

## 17.307 buffers.h File Reference

NetBurner Buffers API.

```

#include <constants.h>
#include <basictypes.h>
#include <nbrtos.h>

```

### Functions

- uint16\_t [GetFreeCount](#) ()  
*Returns the number of free buffers in the system. Buffers are used for both serial and network interfaces.*
- void [ShowBuffer](#) (PoolPtr p)  
*Prints a pool buffer to stdout.*

### 17.307.1 Detailed Description

NetBurner Buffers API.

#include <stdio.h>
#include <ssh/NetBurner/UserAuthManager.h>

```

### Macros

- #define **CMD\_OK** (0)  
*Function was executed properly.*
- #define **CMD\_CLOSE** (1)  
*Connection closed.*
- #define **CMD\_FAIL** (2)  
*General function failed.*
- #define **CMD\_AUTH\_FAIL** (3)  
*Authorization failed.*
- #define **CMD\_TO\_MANY\_FDS** (4)  
*Too many file descriptors currently in use.*
- #define **CMD\_FAILED\_SSH\_KEY\_GEN** (5)  
*Unable to correctly generate key needed for SSH connections.*
- #define **CMD\_DIS\_CAUSE\_TIMEOUT** (1)  
*Connection timed out.*
- #define **CMD\_DIS\_CAUSE\_CLOSED** (2)  
*Connection closed.*
- #define **CMD\_DIS\_SOCKET\_CLOSED** (3)

- Socket closed. Don't send a response for this case.*
- `#define CMD_DIS_AUTH_FAILED (4)`

*Authorization failed. Don't send a response for this case.*

## Enumerations

- enum `ListenOn` : `int8_t { eListenOnTcp = 1 , eListenOnSsh = 2 }`

*The various remote channels that the command processor can listen to.*

## Functions

- int `CmdStartCommandProcessor` (int priority)

*Start the command processor.*
- int `CmdAddCommandFd` (int fd, bool require\_auth, bool time\_out\_conn, bool local\_echo=true)

*Add an established FD connection to the list of fd's managed by the command processor.*
- int `CmdRemoveCommandFd` (int fd)

*Remove an established FD (either a TCP session, a serial connection, or an SSH session).*
- int `CmdListenOnTcpPort` (uint16\_t port, int do\_telnet\_processing, int max\_connections)

*Start listening for a connection over TCP.*
- int `CmdListenQuietOnTcpPort` (uint16\_t port, int do\_telnet\_processing, int max\_connections)

*Start listening for a connection over TCP, but without the siggnon or password.*
- int `CmdListenOnSshPort` (uint16\_t port, int max\_connections)

*Start listening for a connection over SSH.*
- int `CmdListenQuietOnSshPort` (uint16\_t port, int max\_connections)

*Start listening for a connection over SSH, but without the siggnon or password.*
- int `CmdStopListeningOnTcpPort` (uint16\_t port)

*Stop Listening for connections on the specified port. Also closes all open connections that were based on that port.*
- int `CmdStopListeningOnSshPort` (uint16\_t port)

*Stop Listening for connections on the specified port. Also closes all open connections that were based on that port.*
- void `SendToAll` (const char \*buffer, int len, bool include\_serial\_ports)

*Send a message to all connected sockets, excluding "Listening sockets".*

## Variables

- int(\* `CmdAuthenticateFunc` )(const char \*name, const char \*passwd)

*External Authentication function CALLBACK for TCP connections, used to verify username and password. If this function pointer is not NULL then each new Telnet session will be asked to authenticate.*
- int(\* `CmdAuthenticateSshFunc` )(const char \*name, const char \*authVal, `AuthType` authType)

*External Authentication function CALLBACK for SSH connections, used to verify username and password. If this function pointer is not NULL then each new SSH session will be asked to authenticate. If this function pointer is NULL, it tries to use CmdAuthenticateFunc instead.*
- int(\* `CmdCmd_func` )(const char \*command, FILE \*fRespondto, void \*pData)

*The command processing callback function for handling string commands.*
- int(\* `CmdChar_func` )(char command, FILE \*fRespondto, void \*pData)

*The command processing callback function for handling single character commands. If this is implemented does not do echo or line editing this is the responsibility of the application programmer.*
- void (\* `CmdConnect_func` )(FILE \*fRespondto)

*Connect callback function. If this function is not NULL, then the system will call this function every time a new session is started.*
- void(\* `CmdPrompt_func` )(FILE \*fRespondto, void \*pData)

*Prompt callback function. If this function is not NULL, then the system will call this function every time a new prompt line needs to be displayed.*
- void(\* `CmdDisConnect_func` )(FILE \*fRespondto, int cause, void \*pData)

*Dis-Connect callback function, if this function is not NULL then the system will call this function every time a session is terminated.*

- int `CmdIdleTimeout`
- const char \* `Cmdlogin_prompt`

*If this is defined, then it will be sent to the socket on connection before Authentication is tried.*

#include <string.h>
#include <utils.h>
#include <plat_cfg_types.h>

```

### Classes

- class [config\\_obj](#)
  - Base class used to create configuration objects.*
- class [config\\_value](#)

- Base class used to create a configuration value.*

  - class `config_uint`  
*Unsigned 32-bit Integer Configuration Variable.*
  - class `config_int`  
*Signed 32-bit Integer Configuration Variable.*
  - class `config_double`  
*Double Float Configuration Variable.*
  - class `config_bool`  
*Boolean Configuration Variable.*
  - class `config_string`  
*String Configuration Variable.*
  - class `config_pass`  
*Password string Configuration Variable.*
  - class `config_IPADDR4`  
*Configuration Variable for IPADDR4 (IPv4) object types.*
  - class `config_IPADDR`  
*Configuration Variable for IPADDR (IPv6) object type.*
  - class `config_MACADR`  
*Configuration Variable for MACADR object type.*
  - class `config_chooser`  
*Chooser Configuration Variable - Select From a List of Items.*

## Functions

- void `SaveConfigToStorage ()`  
*Save configuration to flash storage.*

## Variables

- const uint32\_t `fConfigValueLeaf` = 0x01  
*Value is a leaf.*
- const uint32\_t `fConfigReadOnly` = 0x02  
*Variable is read-only.*
- const uint32\_t `fConfigModified` = 0x04  
*Variable has been modified, but not yet saved.*
- const uint32\_t `fConfigHidden` = 0x08  
*Not visible to configuration web server display.*
- const uint32\_t `fConfigNoSave` = 0x10  
*Do not save to flash memory when save functions are called.*
- const uint32\_t `fConfigNoObscure` = 0x20  
*Do not obscure the value.*
- const uint32\_t `fConfigNeedReboot` = 0x40  
*System reboot required for changes to take effect.*
- const uint32\_t `fConfigNoReload` = 0x80  
*Disable reloading value from flash during a call to ReloadFromFlash.*
- const uint32\_t `fConfigDetached` = 0x100  
*Disable reloading value from flash during a call to ReloadFromFlash.*
- const uint32\_t `fConfigIsDefault` = 0x200  
*Value is unchanged from the default, i.e. was never set.*

### 17.314.1 Detailed Description

Configuration object header file.

00021 PLEASE READ THIS BEFORE MODIFYING TICKS_PER_SECOND
00022
00023 Before you change this value understand what changing it does.
00024 Making it faster only slows things down. It does not speed up task switches,
00025 If only changes the granularity of time delays and timeouts.
00026 Task switches happen much much faster than the tick interval. They happen as
00027 soon as one task blocks or an interrupt /or task causes a higher priority task
00028 to be unblocked. The Time tick has NOTHING to do with task switches.
00029
00030 If you change it to the maximum 200 you have increased the RTOS overhead by a factor
00031 of 10 and have actually slowed your system.

### Ethernet buffer defines

*OS Maximum Interrupt Level*

*OS\_MAX\_IRQ\_MASK - Optional, Maximum IRQ level that the RTOS is allowed to mask. RTOS objects may not be used in ISRs above this level.*

- #define **ETHER\_BUFFER\_SIZE** 1548
- #define **ETH\_MAX\_PAYLOAD** (1500)
- #define **ETH\_MAX\_SIZE** (1522)
- #define **ETH\_MIN\_SIZE** (46)
- #define **IP\_HEADER\_SIZE** (20)
- #define **UDP\_HEADER\_SIZE** (8)
- #define **MAX\_UDPDATA** (**ETH\_MAX\_PAYLOAD** - (**IP\_HEADER\_SIZE** + **UDP\_HEADER\_SIZE**))
- #define **SERIAL\_TX\_BUFFERS** (2)  
*ETHERN\_BUFFER\_SIZE = bytes of serial TX fifo.*
- #define **SERIAL\_RX\_BUFFERS** (2)  
*ETHERN\_BUFFER\_SIZE = bytes of serial RX fifo.*
- #define **stdin\_buffer\_size** (200)

### System task priorities

*Restating the NBRtos RTOS Library document (NBRtosLibrary.pdf) Lowest priority is OS\_MAX\_PRIOS-1, 1 is the highest. There can only be one task at each priority level. Idle task is created at priority 63.*

*UserMain is created at priority 10. It is recommended and is supported by examples and default projects that a call to OSChangePrio( MAIN\_PRIO ); be made to lower the priority to the range recommended for the main application.*

*Factory applications use priorities 46 through 56.*

*Netburner Runtime library support and driver tasks use 36 through 45.*

*Care should be taken in use of priorities it can affect reliability and performance.*

- #define **MAIN\_PRIO** (50)  
*Recommend UserMain priority.*

### Runtime library driver and support task priorities

- #define **USB\_HW\_PRIO** (45)
- #define **PPP\_PRIO** (44)

- #define **SECURITY\_TASK\_PRIO** (43)
- #define **WIFI\_STATION\_TASK\_PRIO** (42)
- #define **WIFI\_TASK\_PRIO** (41)
- #define **CONFIG\_SERVER\_PRIO** (40)
- #define **HTTP\_PRIO** (39)
- #define **ETHER\_SEND\_PRIO** (38)

### Stack size definitions

SSH requires larger stacks for session key generation see [predef.h](#)

- #define **MAIN\_TASK\_STK\_SIZE** (3072)
- #define **IP\_STK\_SIZE** (2048)
- #define **TCP\_STK\_SIZE** (3072)
- #define **HTTP\_STK\_SIZE** (3072)
- #define **IDLE\_STK\_SIZE** (2048)
- #define **ETHER\_SEND\_STK\_SIZE** (2048)
- #define **PPP\_STK\_SIZE** (2048)
- #define **USB\_HW\_STK\_SIZE** (2048)
- #define **USER\_TASK\_STK\_SIZE** (3072)

### TCP definitions

- #define **DEFAULT\_TCP4\_MSS** (512)
- #define **DEFAULT\_TCP6\_MSS** (1200)
- #define **TCP\_CONN\_TO** (75 \* [TICKS\\_PER\\_SECOND](#))  
*75 seconds Min*
- #define **TCP\_ACK\_TICK\_DLY** ([TICKS\\_PER\\_SECOND](#) / 5)  
*200 msec delayed ACK timer*
- #define **TCP\_BUFFER\_SEGMENTS** (5)  
*Store 4 segments max in tx and rx buffers allows fast retransmit when packets lost.*
- #define **HTTP\_TIMEOUT** ([TICKS\\_PER\\_SECOND](#) \* 10)  
*10 idle Seconds and a partially received request is abandoned*
- #define **HTTP\_READ\_TIME\_LIMIT** (30)  
*Seconds to allow reading to avoid denial of service.*
- #define **HTTP\_RX\_BUFFERSIZE** (10000)
- #define **MAX\_HTTP\_PENDING\_SOCKETS** (5)  
*Number of sockets allowed to be pending on listening socket, performance will degrade < 3.*
- #define **MAX\_HTTP\_CONNECTED\_SOCKETS** (5)  
*Number of sockets allowed to be connected to http server simultaneously.*
- #define **MAX\_HTTP\_POST\_VAR\_NAME\_SIZE** (256)  
*Max HTTP POST variable name length.*

- #define **MAX\_HTTP\_POST\_VAR\_VALUE\_SIZE** (256)  
*Max HTTP POST variable value length.*
- #define **DHCP\_DEFAULTTIMEOUT** (4)
- #define **DHCP\_DEFAULTRETRY** (5)
- #define **DHCP\_MAXTIMEOUT** (64)

#### File Descriptor (FD) definitions

*FDs are preallocated: STDOUT STDIN STDERR <-SERIAL\_SOCKET\_OFFSET Serial 0 Serial 1 <-TCP\_↔  
SOCKET\_OFFSET TCP FD's <-EXTRA\_IO\_OFFSET Extra FDS*

- #define **SERIAL\_SOCKET\_OFFSET** (3)
- #define **TCP\_SOCKET\_OFFSET** (5)
- #define **TCP\_SOCKET\_STRUCTS** (128)
- #define **EXTRA\_IO\_OFFSET** (**TCP\_SOCKET\_OFFSET** + **TCP\_SOCKET\_STRUCTS**)
- #define **EXTRA\_FDS** (122)
- #define **TOTAL\_FDS** (**TCP\_SOCKET\_OFFSET** + **TCP\_SOCKET\_STRUCTS** + **EXTRA\_FDS**)
- #define **FDSET\_ELEMENTS** ((**TOTAL\_FDS**) / 32)

#### Enable SRAM Definitions

*If **ENABLE\_SRAM\_SYS** is **TRUE**, then the processor's on-chip SRAM will be used for fast network buffering and OS tasks as defined below:*

- #define **FAST\_SYSTEM\_VARIABLES**

#### System Tasks

*Uncommented system tasks will be stored in SRAM, otherwise SDRAM will be used.*

- #define **FAST\_MAIN\_STACK**
- #define **FAST\_ETHERNET\_VARIABLES**
- #define **FAST\_ETHERNET\_STACK**
- #define **FAST\_BUFFERS\_VARIABLES**
- #define **FAST\_BUFFERS**
- #define **FAST\_IP\_VARIABLES**
- #define **FAST\_IP\_STACK**
- #define **FAST\_TCP\_VARIABLES**
- #define **FAST\_TCP\_STACK**
- #define **FAST\_USB\_VARIABLES**
- #define **FAST\_USB\_STACK**

- #define **FAST\_HTTP\_STACK**

#### User Variable/Stack SRAM Definitions

If these defines are enabled, any user variables or tasks declared with `FAST_USR_STK` or `FAST_USR_VAR` will be stored in SRAM.

- #define **FAST\_USER\_VARIABLES**
- #define **FAST\_USER\_STACK**
- #define **FAST\_TLS\_VARIABLES**

#### Config server stuff

- #define **NumberOfConfigWebChannels** 12
- #define **ConfigActionIdleTimeout** (`TICKS_PER_SECOND * 30`)
- #define **MAX\_HDR\_SIZE** (256)  
*Size of web client receive single header maximum.*
- #define **MAX\_CONFIG\_TCP\_OUTPUT\_BUFFERS** (40)

### 17.323.1 Detailed Description

NetBurner System Constants.

## 17.325 convert.h File Reference

NetBurner PEM Conversion.

```
#include <basictypes.h>
```

### Macros

- #define **CONVERT\_BUFFER\_LENGTH\_MAX**  $((4 * 1024) - 1)$   
*Minimum data buffer length in bytes.*

## Functions

- int [ConvertPEMFormattedData](#) (puint8\_t dataPtr, const char \*pemEncodedData, uint32\_t dataSize, puint32\_t convertedDataLength, char \*\*nextPtr=NULL)  
Convert data from Privacy-enhanced Electronic Mail (PEM) format to binary.
- uint16\_t [convertLittleEndianWord](#) (uint16\_t hData)  
Convert multibyte host format data to/from little endian.
- uint32\_t [convertLittleEndianDword](#) (uint32\_t hData)  
Convert multibyte host format data to/from little endian.

## 17.338 dhcpd.h File Reference

NetBurner [DHCP](#) Server.

```

#include <predef.h>
#include <constants.h>
#include <buffers.h>
#include <nettypes.h>

```

### Classes

- struct [DHCP::DhcpLeaseRequest](#)  
*Lease Request.*
- struct [DHCP::DhcpLeaseData](#)  
*Lease Data.*
- struct [DHCP::DhcpInfo](#)  
*DHCP Info.*
- class [DHCP::LeaseAllocator](#)  
*Base class/interface for lease allocators for the DHCP server.*
- class [DHCP::SingleAllocator](#)  
*Stripped down allocator Fails to conform to many standard behaviors, but shows the basics of what needs to be implemented.*
- class [DHCP::BlockAllocator](#)  
*Basic allocator that handles multiple leases in a contiguous IP block.*
- class [DHCP::MacPrefixAllocator](#)  
*Derived from BlockAllocator Has the ability to whitelist/blacklist certain mac address ranges based on a mask. Useful for allocating addresses based on device manufacturer.*
- class [DHCP::Server](#)  
*DHCP Server class Requires a lease allocator to be added in order to function.*

**Namespaces**

- namespace `DHCP`  
*DHCP Namespace.*

**Typedefs**

- typedef enum `DHCP::LeaseState` `DHCP::LeaseState_t`  
*Lease State.*

**Enumerations**

- enum `DHCP::LeaseState` {  
`DHCP::LEASE_OPEN` = 0x0 , `DHCP::LEASE_OFFERED` = 0x1 , `DHCP::LEASE_TAKEN` = 0x2 ,  
`DHCP::LEASE_STATIC` = 0x3 ,  
`DHCP::ARP_CONFLICT` = 0x4 }  
*Lease State.*

**Functions**

- bool `AddStandardDHCPServer` (int intf=0, `IPADDR4` startAddr=`IPADDR4::NullIP`())  
*Starts a standard allocator DHCP server.*

**17.338.1 Detailed Description**

NetBurner `DHCP` Server.

The DHCPD library provides a `DHCP` server daemon such that the NetBurner module can provide leases to other devices on the same network. The standard reference implementation also implements a discovery mechanism which will only enable the server if no other server is present when initiated.

00018
00019 /*-----
00020 fgets()
00021
00022 Description
00023 Reads at most len-1 characters from fp until a newline is found.
00024 The characters including the newline (0x0A) are stored in buf.
00025 The buffer is terminated with a NULL.
00026
00027 Returns
00028 fgets returns the buffer passed to it, with the data filled in.
00029 If end of file occurs with some data already accumulated, the
00030 data is returned with no other indication. If no data are read,
00031 NULL is returned instead.
00032
00033 Note that fgets returns all of the data, while gets removes the
00034 trailing newline (with no indication that it has done so.)

## 17.368 fdprintf.h File Reference

NetBurner functions to printf to a file descriptor.

```
#include <stdarg.h>
```

### Functions

- int [fdprintf](#) (int fc, const char \*format,...)  
*printf to a file descriptor*
- int [fdiprintf](#) (int fc, const char \*format,...)  
*printf to a file descriptor with integer (no floating point) support*
- int [vfdprintf](#) (int fc, const char \*format, va\_list arg)  
*printf to a file descriptor using va\_list arguments*
- int [vfdiprintf](#) (int fc, const char \*format, va\_list arg)  
*printf to a file descriptor with integer (no floating point) support using va\_list arguments*

### 17.368.1 Detailed Description

NetBurner functions to printf to a file descriptor.

*Network error.*

### Functions

- int **FTP\_InitializeSession** (IPADDR4 server\_address, uint16\_t port, PCSTR UserName, PCSTR Password, uint32\_t time\_out)  
*Initialize a FTP session with a FTP server.*
- int **FTP\_CloseSession** (int session)  
*Close a FTP session.*
- int **FTPGetDir** (int ftp\_Session, char \*dir\_buf, int nbytes, uint16\_t timeout)  
*Get the current working directory.*
- int **FTPSetDir** (int ftp\_Session, const char \*new\_dir, uint16\_t timeout)  
*Set the current working directory.*
- int **FTPDeleteDir** (int ftp\_Session, const char \*dir\_to\_delete, uint16\_t timeout)  
*Delete a directory.*
- int **FTPMakeDir** (int ftp\_Session, const char \*dir\_to\_make, uint16\_t timeout)  
*Create a new directory.*
- int **FTPUpDir** (int ftp\_Session, uint16\_t timeout)  
*Move up one directory level.*
- int **FTPDeleteFile** (int ftp\_Session, const char \*file\_name, uint16\_t timeout)  
*Delete a file.*
- int **FTPRenameFile** (int ftp\_Session, const char \*old\_file\_name, const char \*new\_file\_name, uint16\_t timeout)  
*Rename a file.*
- int **FTPSendFile** (int ftp\_Session, const char \*full\_file\_name, BOOL bBinaryMode, uint16\_t timeout)  
*Initialize the process to send a file to s FTP server.*
- int **FTPGetFile** (int ftp\_Session, const char \*full\_file\_name, BOOL bBinaryMode, uint16\_t timeout)  
*Initialize the process to get a file from a FTP server.*
- int **FTPGetList** (int ftp\_Session, const char \*full\_dir\_name, uint16\_t timeout)  
*Initialize the process to receive a directory listing from a FTP server.*

- int [FTPGetFileNames](#) (int ftp\_Session, const char \*full\_dir\_name, uint16\_t timeout)  
*Initialize the process to receive just the file names in a directory from a FTP server.*
- int [FTPRawCommand](#) (int ftp\_Session, const char \*cmd, char \*cmd\_buf, int nbytes, uint16\_t timeout)  
*Send a FTP command to the FTP server.*
- int [FTPGetCommandResult](#) (int ftp\_Session, char \*cmd\_buf, int nbytes, uint16\_t timeout)  
*Returns the result of the last FTP operation.*
- int [FTPRawStreamCommand](#) (int ftp\_Session, const char \*cmd, int \*pResult, char \*cmd\_buf, int nbytes, uint16\_t timeout)  
*Send a command and receive a response over a stream connection.*
- void [FTPActiveMode](#) (int ftp\_Session)  
*Set mode to active.*
- void [FTPPassiveMode](#) (int ftp\_Session)  
*Set mode to passive.*

*No such file.*
- #define **FTPD\_FILE\_SIZE\_UNKNOWN** (0)  
*File size unknown.*

### Functions

#### FTP Session callback functions that must be implemented by the programmer

- void \* **FTPDSessionStart** (const char \*user, const char \*passwd, const IPADDR4 hi\_ip)  
*Start an FTP user session (User) This function is called following the creation of a new FTP session. The function needs to determine the validity of the user/password pair. The returned void pointer will be passed to all access functions, which will be asked to determine the validity of the operation based on the permissions associated with the return value.*
- void **FTPDSessionEnd** (void \*pSession)  
*Indicate an FTP user session will be terminated. This callback function gives the user program the opportunity to clean up any storage associated with the void pointer returned from the FTPSessionStart( ) call.*

#### FTP Directory callback functions that must be implemented by the programmer

- int **FTPD\_DirectoryExists** (const char \*full\_directory, void \*pSession)  
*Called by the FTP Server to test for the existence of a directory Called by the FTP Server as the result of an attempt to change to a new directory. This function can also be used to validate the permissions of the session. This function must be implemented by the programmer.*
- int **FTPD\_CreateSubDirectory** (const char \*current\_directory, const char \*new\_dir, void \*pSession)  
*Called by the FTP Server to create a directory Called by the FTP Server as the result of an attempt to create a new directory. This function can also be used to validate the permissions of the session. This function must be implemented by the programmer.*
- int **FTPD\_DeleteSubDirectory** (const char \*current\_directory, const char \*sub\_dir, void \*pSession)  
*Called by the FTP Server to delete a directory Called by the FTP Server as the result of an attempt to delete a subdirectory. This function call can be used to validate the permissions of this session. This function must be implemented by the programmer.*
- int **FTPD\_ListSubDirectories** (const char \*current\_directory, void \*pSession, FTPDCallBackReportFunc \*pFunc, int handle)

Called by the FTP Server to list all subdirectories under the current directory Called by the FTP Server as the result of a client's attempt to list the contents of a directory. This function must be implemented by the programmer.

### FTP file callback functions that must be implemented by the programmer

- int [FTPD\\_FileExists](#) (const char \*full\_directory, const char \*file\_name, void \*pSession)  
*Report on the whether or not a file exists Check for the existence of a file, usually just before an attempt is made to download the file. This function must be implemented by the programmer.*
- int [FTPD\\_GetFileSize](#) (const char \*full\_directory, const char \*file\_name)  
*Returns the size of a specific file.*
- int [FTPD\\_SendFileToClient](#) (const char \*full\_directory, const char \*file\_name, void \*pSession, int fd)  
*Send the contents of a file to a file descriptor Send a file to a FTP client. This function must be implemented by the programmer.*
- int [FTPD\\_AbleToCreateFile](#) (const char \*full\_directory, const char \*file\_name, void \*pSession)  
*Report on the ability to create/receive a file Determine if a file can be created. This function must be implemented by the programmer.*
- int [FTPD\\_GetFileFromClient](#) (const char \*full\_directory, const char \*file\_name, void \*pSession, int fd)  
*Create/get a file Receive a file from the FTP client. This function must be implemented by the programmer.*
- int [FTPD\\_DeleteFile](#) (const char \*current\_directory, const char \*file\_name, void \*pSession)  
*Delete a file Delete a file. This function must be implemented by the programmer.*
- int [FTPD\\_Rename](#) (const char \*current\_directory, const char \*cur\_file\_name, const char \*new\_file\_name, void \*pSession)  
*Rename a file Rename a file. This function must be implemented by the programmer.*
- int [FTPD\\_ListFile](#) (const char \*current\_directory, void \*pSession, [FTPDCallbackReportFunc](#) \*pFunc, int handle)  
*Lists all files in the current directory List all files in the current directory. This function must be implemented by the programmer.*

### Initialization functions

- typedef void [FTPDCallbackReportFunc](#)(int handle, const char \*name\_to\_report)  
*FTP Session callback typedef Typedef for all directory reporting callbacks This callback type definition is used by the directory reporting functions.*
- int [FTPDStartSSL](#) (uint16\_t port, uint8\_t server\_priority, bool enableFTPS=false, bool encryptData=false)  
*Starts the FTP Server task (SSL) Listens for incoming connections. Only one instance of the FTPD is allowed.*
- int [FTPDStart](#) (uint16\_t port, uint8\_t server\_priority)  
*Starts the FTP Server task (non-SSL/TLS) Listens for incoming connections. Only one instance of the FTPD is allowed. If FTPD SSL support exists, [FTPDStartSSL\(\)](#) may be used instead.*
- int [FTPDStopReq](#) ()  
*Stops the FTP Server task Sends a stop request to the currently running FTPD.*

## 17.391 gdbstub.h File Reference

NetBurner GDB Stub.

### Functions

#### Stub Initialization functions

- void [InitGDBStub](#) (int port, int baudrate)  
*Start the GDB stub and then immediately stop at a break point This function will start the GDB stub, and will stop immediately at a breakpoint. This function is best used during development to stop the system from executing questionable code at startup. It is also useful to control the system execution to debug startup and initialization code.*
- void [InitGDBStubNoBreak](#) (int port, int baudrate)  
*Start the GDB stub and continue without stopping This function will start the GDB stub, and continue with normal program execution. This function is best used to debug a program that is operating correctly and has intermitant bugs or anomallies. The program will run as normal until you connect the debugger. Thus you can operate the program until one needs to debug it.*

## 17.393 hal.h File Reference

NetBurner Hardware Abstraction Layer (HAL)

```
#include <stdint.h>
#include <crypto/ssl.h>
#include <crypto/openssl/ssl.h>
```

### Functions

- void [HardwareSetup](#) ()  
*Initializes the system hardware such as the timer, cache and clock speed.*

- void **PostConfigHardwareInit** ()  
*Initializes the system hardware that depend on config variables such as the watchdog.*
- void **ForceReboot** (bool bFromException=false)  
*Forces the system hardware to perform a soft reset.*
- int **HalStorage\_Save** (uint8\_t area, void \*pData, int len, int offset=0)  
*Save a blob to a specific persistent storage area as defined by the platform. This routine will perform all storage maintenance routines necessary to ensure a valid write.*
- int **HalStorage\_SavePartial** (uint8\_t area, void \*pData, int len, int offset)  
*Save a blob to a specific persistent storage area as defined by the platform. This routine requires that any maintenance required for a valid write be explicitly performed prior to being called.*
- int **HalStorage\_Prepare** (uint8\_t area, int len, int offset=0)  
*Prepare a storage area for writing new data. For platforms with direct flash mapping this function is an alias for HalStorage\_Erase.*
- int **HalStorage\_Finalize** (uint8\_t area)  
*Finalize a storage area after writing new data. This will perform any final completion or cleanup routines required to persist the previously saved data from HalStorage\_SavePartial calls.*
- int **HalStorage\_Erase** (uint8\_t area, int len=-1, int offset=0)  
*Erase all or part of a storage area. Note: due to physical storage granularities, the total area erased may extend beyond the requested area.*
- int **HalStorage\_GetAllocated** (uint8\_t area)  
*Obtain the total size allocated to the given persistent storage area.*
- int **HalStorage\_GetMaxAllocation** (uint8\_t area)  
*Obtain the maximum size that may be allocated to the given persistent storage area. For direct flash mapped platforms, this is aliased to HalStorage\_GetAllocated.*
- int **HalStorage\_RemainingSpace** (uint8\_t area)  
*Obtain the number of remaining bytes available to be written in the given persistent storage area.*
- int **HalStorage\_WriteOffset** (uint8\_t area)  
*Get the offset of the next byte that can be written in the given persistent storage area.*
- int **HalStorage\_AddressOffset** (uint8\_t area, void \*pWhere)  
*Get the offset within a persistent storage area of an address. A platform may map any address to any offset of its choosing for a given storage area, and may modify its behavior on an area by area basis.*
- void **FlashErase** (void \*pWhere, int len)  
*Erases the flash memory.*
- void **FlashProgram** (void \*pWhere, void \*pWhat, int len)  
*Program flash memory.*
- void **FlashProgramApplImage** (void \*pWhere, void \*pWhat, int len)  
*Write an application image to flash memory.*
- void **DisableCache** ()  
*Disable the instruction and data cache.*
- void **EnableCache** ()  
*Enable the instruction and data cache.*
- uint32\_t **spaceleft** ()  
*Report how much free unallocated space is left in dynamic memory.*
- uint16\_t **HalGetTickFraction** (void)  
*Returns the fraction of the current system time tick.*
- void **StdioCheckIntc** (void)  
*Check STDIO interrupt sources.*
- void **SysLogCheckIntc** (void)  
*This is just like the StdioCheckIntc() function, except that the results are displayed via UDP.*
- bool **HalDeviceCertValid** ()  
*Determine if the stored certificate is valid.*
- uint8\_t \* **HalGetDeviceCert** ()

- Get a pointer to the stored certificate.*

  - `uint16_t HalGetDeviceCertLen ()`  
*Get the length of the stored certificate.*
  - `uint8_t * HalGetDeviceKey ()`  
*Get a pointer to the stored certificate.*
  - `uint16_t HalGetDeviceKeyLen ()`  
*Get the length of the stored key.*
  - `bool HalSaveNewDeviceCert (const uint8_t *cert, uint16_t certlen, uint8_t format=SSL_FILETYPE_PEM)`  
*Save a device certificate in persistent storage.*
  - `bool HalSaveNewDeviceKey (const uint8_t *key, uint16_t keylen, uint8_t format=SSL_FILETYPE_PEM)`  
*Save a device key in persistent storage.*
  - `void HalEraseDeviceCertAndKey ()`  
*Clear the device certificate and key from persistent storage.*

### Variables

- `void(* watchdog_service_function )(void)`  
*Watchdog callback service function.*
- `uint32_t HalTickMaxCount`  
*Rollover value for the system hardware tick timer.*

### Classes

- struct [HTTP\\_Request](#)  
*HTTP Request Structure.*
- class [HtmlPageHandler](#)  
*Base class for all GET handlers. To handle GET requests for a specific URL in your application, build a GET handler object for that specific URL. A NULL name will be a catch all for all GET requests.*
- class [CallBackFunctionPageHandler](#)  
*Implements the [HtmlPageHandler](#) class as a function pointer callback for GET requests.*

### Typedefs

- typedef int [http\\_gethandlerfunc](#)(int sock, [HTTP\\_Request](#) &pd)  
*Implements the [HtmlPageHandler](#) class as a function pointer callback for GET requests.*

### Enumerations

- enum [HTTP\\_RequestTypes](#) { [tUnknown](#) , [tGet](#) , [tPost](#) , [tHead](#) }  
*HTTP request types for HTTP page handler callback functions.*
- enum [HTTP\\_ACCESS](#)  
*HTTP page access return values.*

### Functions

- [HTTP\\_Request](#) \* [GetActiveHttpRequest](#) ()  
*Get the current active running http request. Only valid from within http get or post handling. Also valid during page fill in operations.*
- [HTTP\\_ACCESS](#) [CheckHttpAccess](#) (int sock, int access\_level, [HTTP\\_Request](#) &Req)  
*All HTTP requests go through this function.*
- void [StartHttp](#) (uint16\_t port, bool RunConfigMirror)  
*Start the HTTP web server. Further documentation in the Initialization section [Initialization - System Initialization Functions](#).*
- void [StopHttp](#) ()  
*Stop the HTTP web server.*
- void [SendHTMLHeader](#) (int sock)  
*Send a HTML response header.*
- void [SendHTMLHeaderWCookie](#) (int sock, char \*cookie)  
*Send a HTML response header and cookie.*
- void [SendTextHeader](#) (int sock)  
*Send a HTML plain text header.*
- void [SendGifHeader](#) (int sock)  
*Send a HTML GIF header.*
- void [EmptyResponse](#) (int sock)  
*Send an empty response back.*
- void [NoContentResponse](#) (int sock)  
*Send a no content response back.*
- void [RedirectResponse](#) (int sock, PCSTR new\_page)

- *Redirect a HTTP request to a different page.*
- void [NotFoundResponse](#) (int sock, PCSTR new\_page)
  - *Send a page not found response.*
- void [ForbiddenResponse](#) (int sock, PCSTR new\_page)
  - *Send a page is forbidden response.*
- void [NotAvailableResponse](#) (int sock, PCSTR new\_page)
  - *Send a response indicating that the requested resource is not available at this time.*
- void [BadRequestResponse](#) (int sock, PCSTR url, PCSTR data)
  - *Send a response indicating that the client request itself is faulty in some manner.*
- int [writeallsafestring](#) (int fd, PCSTR str)
  - *Send a string and escape all special characters.*
- int [writesafestring](#) (int fd, PCSTR str, size\_t strLength)
  - *Send a string with a specified length and escape all special characters.*
- int [httpstricmp](#) (PCSTR str1, PCSTR str1sUpper2)
  - *Special string compare. Returns 1 if the strings match until one string ends with a null (0).*

NetBurner System Initialization Header File.

```

#include <predef.h>
#include <constants.h>
#include <basictypes.h>
#include <ctype.h>
#include <stdio.h>

```

### Functions

- void [init](#) ()
  - System initialization. Ideally called at the beginning of all applications, since the easiest Recovery procedures pause execution inside of `init`, which is impossible if there is a crash before `init`.*
- void [StartHttp](#) (uint16\_t port=80)
  - Start the HTTP web server.*
- void [StartHttps](#) (uint16\_t ssl\_port=443, uint16\_t http\_port=80)
  - Start the HTTPS secure web server.*
- bool [WaitForActiveNetwork](#) (uint32\_t ticks\_to\_wait=120 \*[TICKS\\_PER\\_SECOND](#), int interface=-1)
  - Wait for an active network connection on at least one interface.*
- void [EnableSystemDiagnostics](#) ()
  - Turn on the diagnostic reports from the config page.*
- void [EnableSecureConfigServer](#) (bool bSec\_Only)
  - Enable the minimal http config server to operate over TLS.*

## 17.414 iointernal.h File Reference

Extra File Descriptors.

### Functions

- int [GetExtraFD](#) (void \*extra\_data, struct IoExpandStruct \*pFuncs)
  - Returns a file descriptor for the structure passed as the *IoExpandStruct*. [FreeExtraFd\(\)](#) will release the fd back to the pool of available fds.
- void \* [GetExtraData](#) (int fd)
  - Returns the extra structure value from *IoExpandStruct* associated with the file descriptor.
- void [FreeExtraFd](#) (int fd)
  - Free a file descriptor and associated resources.
- int [GetFreeExtraFDCount](#) ()
  - Returns the number of free file descriptors.
- int [GetFreeSocketCount](#) (void)
  - Returns the number of free sockets.

### 17.414.1 Detailed Description

## 17.416 iosys.h File Reference

NetBurner I/O System Library API.

```
#include <constants.h>
#include <stdio.h>
#include <basictypes.h>
```

### Macros

#### I/O Control Options

The legal options for use with [ioctl\(\)](#) and in conjunction with [ioctlCmdFlags](#)

- #define **IOCTL\_TX\_CHANGE\_CRLF** (1)  
When set, transmitted char  $\backslash n$  gets converted to  $\backslash r \backslash n$
- #define **IOCTL\_RX\_CHANGE\_CRLF** (2)  
When set, received  $\backslash r \backslash n$  get turned into  $\backslash n$
- #define **IOCTL\_RX\_PROCESS\_EDITS** (4)  
When set, process backspace and do simple line editing.
- #define **IOCTL\_RX\_ECHO** (8)  
When set, echo chars received to tx.
- #define **IOCTL\_TX\_NO\_BLOCK** (32)  
When set, stdout and stderr will drop output instead of blocking.
- #define **IOCTL\_ALL\_OPTIONS** (15)  
When set, turns on all options.

#### I/O Control Command Flags

The command flags to use in contuction with [ioctl\(\)](#) and [ioctlOptions](#)

- #define **IOCTL\_SET** (0x4000)  
Set an option.
- #define **IOCTL\_CLR** (0x2000)  
Clear an option.

### Typedefs

- typedef void **FDCallback**(int fd, [FDChangeType](#) change, void \*pData)  
Define the function signature for file descriptor notification callbacks.

### Enumerations

#### FD Change Type

The notifications that a registered FD monitor can receive.

- enum **FDChangeType** { [eReadSet](#) , [eWriteSet](#) , [eErrorSet](#) , [eClosingNow](#) }  
The notifications that a registered FD monitor can receive.

### Functions

- int [close](#) (int fd)  
Close the specified file descriptor and free the associated resources.
- int [read](#) (int fd, char \*buf, int nbytes)  
Read data from a file descriptor (fd).
- int [peek](#) (int fd, char \*c)  
Peek at the data for the specified file descriptor (fd). Will block forever until at least one byte is available to be read. The byte returned is not removed from the fd buffer, it will be the first byte of data returned on any subsequent read operation.
- int [write](#) (int fd, const char \*buf, int nbytes)

Write data to the stream associated with a file descriptor (*fd*). Can be used to write data to *stdio*, a TCP socket, or a Serial port.

- int [writestring](#) (int *fd*, const char \**str*)
 

Write a null terminated ascii string to the stream associated with a file descriptor (*fd*). Can be used to write data to *stdio*, a TCP socket, or a Serial port.
- int [writeall](#) (int *fd*, const char \**buf*, int *nbytes*=0)
 

Write the specified number of bytes to a file descriptor. Will block until all bytes are sent, or a file descriptor error occurs (such as a TCP socket error). Can be used to write data to *stdio*, a TCP socket, or a Serial port.
- int [ReadWithTimeout](#) (int *fd*, char \**buf*, int *nbytes*, unsigned long *timeout*)
 

Read data from a file descriptor(*fd*), or return if at least one byte is not read within the specified timeout. Can be used instead of the [read\(\)](#) function, which will block forever until at least one byte is read. File descriptors include such things as *stdio*, TCP sockets, TLS sockets, and Serial ports.
- int [ReadWithTickTimeout](#) (int *fd*, char \**buf*, int *nbytes*, [TickTimeout](#) &*timeout*)
 

Same as [ReadWithTimeout\(\)](#), except the timeout value parameter is of type [TickTimeout](#) instead of an unsigned long. The [TickTimeout](#) object is more robust in terms of sequential timeout calls and rollover protection.
- int [ReadAllWithTimeout](#) (int *fd*, char \**buf*, int *nbytes*, unsigned long *timeout*)
 

Attempt to read the specified number of bytes from a file descriptor, or return with the number of bytes read if the timeout value has expired.
- int [ReadAllWithTickTimeout](#) (int *fd*, char \**buf*, int *nbytes*, [TickTimeout](#) &*timeout*)
 

Same as [ReadWithTimeout\(\)](#), except the timeout value parameter is of type [TickTimeout](#) instead of an unsigned long. The [TickTimeout](#) object is more robust in terms of sequential timeout calls and rollover protection.
- int [readall](#) (int *fd*, char \**buf*, int *nbytes*)
 

Read the specified number of bytes from a file descriptor (*fd*). This function will block until either the requested number of bytes have been read, or a file descriptor error occurs. It can be used to read from *stdio*, TCP sockets, or Serial ports.
- int [PeekWithTimeout](#) (int *fd*, char \**c*, unsigned long *timeout*)
 

This function peeks at data from a file descriptor (*fd*), with a specified timeout value (as opposed to the peek function which will block forever until at least one byte is available to be read). This function can be used to peek from *stdio*, TCP sockets, or Serial ports.
- int [getchar](#) ()
 

Get a character from *stdin*. Will block if no character is available, from *stdio* library. The default *stdin* is the debug serial port.
- int [dataavail](#) (int *fd*)
 

Check the specified file descriptor to determine if data is available to be read.
- int [writeavail](#) (int *fd*)
 

Check the specified file descriptor to determine data can be written.
- int [haserror](#) (int *fd*)
 

Check if a file descriptor has an error.
- int [charavail](#) ()
 

Checks to see if data is available for read on *stdin*. By default, *stdin* is the boot/debug serial port.
- void [RegisterFDCallback](#) (int *fd*, [FDCallback](#) \**fp*, void \**pData*)
 

Register a callback function to receive notification when an FD state changes. Register a NULL *fp* to remove the notification.
- void [FD\\_ZERO](#) (*fd\_set* \**pfds*)
 

Clear (set to 0) a *fd\_set* (file descriptor set) so no file descriptors (*fds*) are selected.
- void [FD\\_CLR](#) (int *fd*, *fd\_set* \**pfds*)
 

A *fd\_set* (file descriptor set) holds a set of file descriptors (*fds*). This function clears or removes a specific file descriptor in an *fd\_set*.
- void [FD\\_SET](#) (int *fd*, *fd\_set* \**pfds*)
 

A *fd\_set* (file descriptor set) holds a set of file descriptors (*fds*). This function sets or adds a specific file descriptor to an *fd\_set*.
- int [FD\\_ISSET](#) (int *fd*, *fd\_set* \**pfds*)
 

A *fd\_set* (file descriptor set) holds a set of file descriptors (*fds*). This function checks whether or not a particular *fd* is set in the specified *fd\_set*.

- int **FD\_OVERLAP** (const fd\_set \*f1, const fd\_set \*f2)  
*A fd\_set (file descriptor set) holds a set of file descriptors (fds). This function determines whether there exists a common file descriptor between the two sets.*
- void **FD\_COPY** (const fd\_set \*from, fd\_set \*to)  
*A fd\_set (file descriptor set) holds a set of file descriptors (fds). This function copies one file descriptor set to another.*
- void **FD\_SETFROMSET** (const fd\_set \*from, fd\_set \*to)  
*A fd\_set (file descriptor set) holds a set of file descriptors (fds). This function adds the file descriptors from one set to another.*
- void **FD\_CLRFROMSET** (const fd\_set \*from, fd\_set \*to)  
*A fd\_set (file descriptor set) holds a set of file descriptors (fds). This function remove the file descriptors in one set from another.*
- int **select** (int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, unsigned long timeout)  
*Wait for events to occur on one or more I/O resources associated with a set of file descriptors (fds), such as data available to be read, a resource is available to write data, or an error has occurred.*
- int **ZeroWaitSelect** (int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds)  
*Returns whether events have occurred on one or more I/O resources associated with a set of file descriptors (fds), and returns immediately.*
- int **ioctl** (int fd, int cmd)  
*This function controls the selection of input/output control options for stdio: stdin = 0, stdout = 1 and stderr = 2.*
- int **ReplaceStdio** (int stdio\_fd, int new\_fd)  
*Maps stdio to any file descriptor (fd).*
- int **CurrentStdioFD** (int stdio\_fd)  
*Returns the current file descriptor mapped to the stdio file descriptor.*
- void **IrqStdio** ()  
*Open the system default serial port in interrupt mode using the system default baud rate, and assign this serial port to stdin, stdout and stderr.*

## 17.416.1 Detailed Description

NetBurner I/O System Library API.

*IP Header (IPv4)*
- struct [IPPKT](#)  
*Internal IPv4 Header.*
- struct [UDPPKT](#)  
*Internal UDP Header.*
- struct [PsudeoHeader](#)  
*UDP IPv4 Pseudo-header segment (bits 0 through 95)*

### Macros

- #define [ICMP\\_PING\\_DATA\\_SIZE](#) (32)  
*size for ICMP echo request and replay ("ping")*

### IP Version

*Uncomment for debugging*

- #define [IP\\_VERSION\\_MASK](#) (0xF0)  
*Version Mask.*
- #define [IP\\_VERSION\\_IPv4](#) (0x40)

- IPv4.  
 • #define **IP\_VERSION\_IPV6** (0x60)  
 IPv6.

### Header Length

- #define **IP\_HEADER\_LENGTH\_MASK** (0x0F)
- #define **IP\_HEADER\_LENGTH\_NO\_OPTIONS** (0x05)

### Flags and Fragment Offset

- #define **IP\_FLAGS\_MASK** (0xE000)
- #define **IP\_FRAGMENT\_OFFSET\_MASK** (0x1FFF)

### IP protocol numbers

- #define **IP\_PROTOCOL\_ICMP** (0x01)
- #define **IP\_PROTOCOL\_IGMP** (0x02)
- #define **IP\_PROTOCOL\_INTERNET** (0x04)
- #define **IP\_PROTOCOL\_TCP** (0x06)
- #define **IP\_PROTOCOL\_UDP** (0x11)

### control message type(s) and code(s)

- #define **ICMP\_TYPE\_ECHO\_REPLY** (0)
- #define **ICMP\_CODE\_ECHO\_REPLY** (0)
- #define **ICMP\_TYPE\_DEST\_UNREACHABLE** (3)
- #define **ICMP\_CODE\_PORT\_UNREACHABLE** (3)
- #define **ICMP\_TYPE\_SOURCE\_QUENCH** (4)
- #define **ICMP\_CODE\_SOURCE\_QUENCH** (0)
- #define **ICMP\_TYPE\_REDIRECT\_MESSAGE** (5)
- #define **ICMP\_TYPE\_ECHO\_REQUEST** (8)
- #define **ICMP\_CODE\_ECHO\_REQUEST** (0)

### Well Known Ports

- #define **IANA\_ECHO\_PORT** (7)
- #define **IANA\_DISCARD\_PORT** (9)
- #define **IANA\_SSH\_PORT** (22)
- #define **IANA\_TELNET\_PORT** (23)
- #define **IANA\_NETBIOS\_NAME\_SERVICE\_PORT** (137)

### Typedefs

- typedef struct **\_IpHeaderIPv4** **IpHeaderIPv4**  
*IP Header (IPv4)*

### Functions

- void **IpProcessEthernetPacket** (PoolPtr poolPtr, uint16\_t packetSizeInBytes)  
*IP packet insertion for processing.*
- uint16\_t **GetSum** (puint16\_t addr, uint16\_t count)  
*Checksum.*
- uint16\_t **GetSum20** (puint32\_t addr)  
*Checksum.*
- uint16\_t **GetSumHdr** (**PseudoHeader** &hdr, puint16\_t addr, uint16\_t count)  
*Checksum using pseudo-header.*
- BOOL **IsMyIp4** (**IPADDR4** ip, int ifc=-1)  
*Is this my IP address?*
- **IPADDR4** **GetSrcIp4** (**IPADDR4** dst)  
*Get source IP address for this destination.*

- **IPADDR4 GetSrcIpwlf4** (int ifn, const **IPADDR4** dst)
- **BOOL IsMyIp** (const **IPADDR** &ip, int ifc=-1)  
*Is this my IP address?*
- **IPADDR GetSrcIp** (const **IPADDR** &dst)  
*Get source IP address for this destination.*
- **IPADDR GetSrcIpwlf** (int ifn, const **IPADDR** &dst)  
*Get source IP address for an interface.*
- void **SendICMPError** (PoolPtr pBadPacket, uint8\_t type, uint8\_t code)  
*Send ICMP error.*
- void **FixHeaderAndSend** (PoolPtr p, **PIPPKT** plp)  
*Complete header and send on primary network interface.*
- void **FixHeaderAndSendViaInterface** (PoolPtr p, **PIPPKT** plp, int Interface)  
*Complete header and send on an interface.*
- void **InitializeStack** ()  
*Initializes the IP stack.*
- int **AddInterface** (**IPADDR4** addr, **IPADDR4** mask, **IPADDR4** gateway, int root\_if)  
*Add an interface with an interface number.*

### Get Packet Functions

#### WARNING:

*If you use these functions on an uninitialized buffer you will get bogus values for the pointer as the header length field in the IP packet is not yet set up!*

- **PIPPKT GetIpPkt** (PoolPtr p)  
*Get IP Packet pointer from network buffer pool buffer.*
- **PIPPKT GetIpPkt** (PEFRAME pFrame)  
*Get IP packet pointer from pointer to frame.*
- **PIPPKT GetIpPkt** (PVLEFRAME pFrame)  
*Get IP Packet pointer from network buffer pool buffer.*
- **PUDPPKT GetUdpPkt** (**PIPPKT** plp)  
*Get UPD packet pointer from IP packet pointer.*

### Variables

#### Global Data

- uint8\_t **bTTL\_Default**  
*Default number of hops (time to live)*
- uint16\_t **wArpLifetime**  
*ARP lifetime in seconds.*
- **BOOL bQuietStart**  
*Quiet start.*

### 17.431.1 Detailed Description

NetBurner DHCPv6 API.

The DHCPv6 Library allows for full DHCPv6 negotiations as a client. It operates in one of two modes: Information Request or Full Solicitation. In the Information Request mode, it will only perform Information Requests, seeking Additional Information from DHCPv6 Servers. This includes things such as DNS Servers, NTP Servers, TFTP Boot Servers, etc, basically everything that isn't assigning an address to the interface requesting the information. In Full Solicitation, the client will perform a full address solicitation and attempt to have assigned at least one address from a DHCPv6 Server. It will also obtain the Additional Information as well.

The DHCPv6 client is automatically started whenever a Router Advertisement (RFC 4861) is detected that has either the Other or Managed bits set. It is also possible to manually launch the DHCPv6 Client by calling an API function.

Finally, as a way to allow user access and extension to the DHCPv6 negotiations, there are a set of Callback functions that will allow access to add requested options and examine responses.

## 17.433 json\_lexer.h File Reference

NetBurner JSON Lexer. See the [JSON Lexer](#) page for complete documentation.

```

#include <buffers.h>
#include <math.h>
#include <nettypes.h>

```

```
#include <webclient/web_buffers.h>
#include <nbstring.h>
#include <fd_adapter.h>
```

## Classes

- struct [JsonAllocString](#)  
A list of large strings that are created with malloc.
- class [JsonRef](#)  
Represents a positional reference (pointer) of a location inside a [ParsedJsonDataSet](#) object
- class [ParsedJsonDataSet](#)  
A class to create, read, and modify a JSON object.
- class [JsonLexerFDAdapter](#)  
Get the type name of the JSON primitive type passed in.

## Typedefs

- typedef void [CharOutputFn](#)(const char \*chars, int len, void \*blob)  
Helper function typedef for print functions.

## Enumerations

- enum [json\\_primitive\\_type](#) {  
UNDEFINED , BEGIN\_ARRAY , BEGIN\_OBJECT , END\_ARRAY ,  
END\_OBJECT , NAME , STRING , VALUE\_SEPERATOR ,  
NUMBER , FALSE\_EL , TRUE\_EL , NULL\_EL ,  
STRING\_TOO\_BIG , ALLOC\_STRING , NOTFOUND , EOF\_EL }

The following types define the basic building blocks that make up a JSON data set. These are the values that will be returned from the functions used to parse the data set. Member functions include operators to return specific data type, as well as type validity checks.

## Functions

- int [SendMail](#) (IPADDR smtp\_server, PCSTR userid, PCSTR from\_addr, PCSTR to\_addr, PCSTR subject, PCSTR textbody)
 

*Send an email message. The function will open a TCP connection to the specified SMTP server, create a message based on the parameters, and send the message.*
- int [SendMailAuth](#) (IPADDR smtp\_server, PCSTR userid, PCSTR pass, PCSTR from\_addr, PCSTR to\_addr, PCSTR subject, PCSTR textbody)
 

*Send an email message with plain text authentication. The function will open a TCP connection to the specified SMTP server, create a message based on the parameters, and send the message.*
- int [SendMailEx](#) (IPADDR smtp\_server, PCSTR userid, PCSTR from\_addr\_rev\_path, PCSTR from\_addr\_↔ memo\_hdr, PCSTR to\_addr, PCSTR subject, PCSTR textbody)
 

*Send an email message function, extended version.*
- int [IsMailError](#) ()
 

*Returns the error status of the last send mail transaction.*
- void [PrintNBError](#) (int fd=0)
 

*If an error occurred, prints the error information received from the SMTP server.*
- void [PrintServerLog](#) (int fd=0)
 

*Prints the server log of the last send mail transaction.*
- int [SendMailAuthStartMIME](#) (IPADDR smtp\_server, PCSTR userid, PCSTR pass, PCSTR from\_addr, PCSTR to\_addr, PCSTR subject, int &fd)
 

*Start a Multi-purpose Internet Mail Extension (MIME) session.*
- int [SendMailAuthAddMIME](#) (int fd, int ContentType, const char \*pContent, const char \*FileName)
 

*Add a MIME part or attachment to an open MIME Session.*
- int [SendMailAuthEndMIME](#) (int fd, PCSTR userid)
 

*Send a MIME email message and close the SMTP session.*
- enum [CONTENT\\_TYPE\\_ENUM](#) {
 

[CONTENT\\_TYPE\\_PLAIN\\_TEXT](#) , [CONTENT\\_TYPE\\_PLAIN\\_TEXT\\_ATTACH](#) , [CONTENT\\_TYPE\\_BINARY\\_ATTACH](#) ,

## 17.446 nbrtos.h File Reference

NetBurner Real-Time Operating System (NBRTOS) API.

```
#include <predef.h>
#include <constants.h>
#include <basictypes.h>
#include <nbrtoscpu.h>
```

## Classes

- class [TickTimeout](#)

*TickTimeout* objects are used to facilitate sequential function calls with timeout parameters that need to be indexed from an initial start time, and to prevent TimeTick rollover errors.
- struct [OS\\_SEM](#)

Semaphores are used to control access to shared resources or to communicate between tasks in a multithreaded system or with interrupt service routines. Semaphores can be 0 or 1, or they can be counting semaphores that increment and decrement based on calls to [Pend\(\)](#) and [Post\(\)](#) functions.
- struct [OS\\_MBOX](#)

Mailboxes are single value storage locations used to communicate between tasks.
- struct [OS\\_Q](#)

A message queue is an object that enables tasks and interrupt service routines to pend and post pointer sized messages. The pointer values typically point to some type of object or structure that contains the actual message or data. A queue functions as a fixed size First In First Out (FIFO) storage for 32-bit void pointers that can be used for communication between tasks.
- struct [TEMPL\\_Q< T >](#)

A convenience wrapper around [OS\\_Q](#).
- struct [os\\_fifo\\_el](#)

[OS\\_FIFO](#) element definition.
- struct [OS\\_FIFO](#)
- struct [OS\\_CRIT](#)

An [OS\\_CRIT](#) object is used to establish critical sections of code that can only be run by one task at a time. Tasks that try to claim a critical section which is currently claimed by another task will stop and wait for that task to release the critical section before continuing execution.
- struct [OS\\_FLAGS](#)

*OSFlags* enables a function or task to pend on multiple flags or events.
- class [OSLockObj](#)

A simple wrapper class that helps use OS locks effectively.
- class [OSCriticalSectionObj](#)

A simple wrapper class that helps utilize [OS\\_CRIT](#) objects more effectively.
- class [OSLockAndCritObj](#)

A simple wrapper class that helps utilize [OS\\_CRIT](#) objects to lock tasks and enter critical sections more effectively.
- class [OSSpinCrit](#)

A simple wrapper class that uses an [OS\\_CRIT](#) object to try and claim a critical section, and will continue the attempt until it is able to do so.
- class [USERCritObj](#)

User critical section object class.
- class [NBRtosInitObj](#)

A simple class to derive from if you are creating tasks that are constructed at global scope and need to do RTOS initialization.

## Macros

- `#define OS_STAT_RDY 0x00`

Ready to run.
- `#define OS_STAT_MBOX 0x01`

Pending on mailbox.

- #define **OS\_STAT\_SEM** 0x02  
*Pending on semaphore.*
- #define **OS\_STAT\_Q** 0x04  
*Pending on queue.*
- #define **OS\_STAT\_FIFO** 0x08  
*Pending on FIFO.*
- #define **OS\_STAT\_CRIT** 0x10  
*Pending on Critical Section.*
- #define **OS\_STAT\_DELAY** 0x20  
*Reserved.*
- #define **OS\_STAT\_RES4** 0x40  
*Reserved.*
- #define **OS\_STAT\_RES5** 0x80  
*Reserved.*
- #define **OS\_NO\_ERR** 0  
*No error.*
- #define **OS\_TIMEOUT** 10  
*Timeout.*
- #define **OS\_MBOX\_FULL** 20  
*Mailbox full.*
- #define **OS\_Q\_FULL** 30  
*Queue full.*
- #define **OS\_Q\_EXISTS** 31  
*Queue already exists.*
- #define **OS\_PRIO\_EXIST** 40  
*Task priority number already exists.*
- #define **OS\_PRIO\_INVALID** 41  
*Invalid task priority number.*
- #define **OS\_SEM\_ERR** 50  
*Semaphore error.*
- #define **OS\_SEM\_OVF** 51  
*Semaphore count overflow.*
- #define **OS\_CRIT\_ERR** 60  
*Critical section error.*
- #define **OS\_NO\_MORE\_TCB** 70  
*No Task Control Blocks (TCB) available to create task.*
- #define **WAIT\_FOREVER** 0  
*Parameter macro used for timeout parameters that have a 0 value and wait forever.*
- #define **OSSimpleTaskCreateName**(x, p, n)  
*Simpler form of creating a new task. Will automatically allocate the default task stack size.*
- #define **OSSimpleTaskCreateNameSRAM**(x, p, n)
- #define **OSSimpleTaskCreateLambda**(p, n, f) LambdaTask2(p,n,[( void \* pv)f,\_\_COUNTER\_\_])  
*This macro functions the same as [OSTaskCreateName\(\)](#).*

## Typedefs

- typedef struct **os\_fifo\_el** OS\_FIFO\_EL  
*OS\_FIFO element definition.*

## Functions

- void [OSFlagSet](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bits\_to\_set)
 

*This function sets the corresponding bits asserted in `bits_to_set` of an [OS\\_FLAGS](#) object pointed to by \*flags.*
- void [OSFlagClear](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bits\_to\_clr)
 

*This function clears the bits asserted in `bits_to_clr` of an [OS\\_FLAGS](#) object pointed to by \*flags..*
- uint8\_t [OSFlagPendAny](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bit\_mask, uint16\_t timeout)
 

*This function waits a number of time ticks specified by `timeout` until any of the flags indicated by `bit_mask` are set.*
- uint8\_t [OSFlagPendAnyNoWait](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bit\_mask)
 

*This function immediately checks to see if any of the flag bits indicated by `bit_mask` are set; it does not wait.*
- uint8\_t [OSFlagPendAll](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bit\_mask, uint16\_t timeout)
 

*This function waits a number of time ticks specified by `timeout` until **all** the flags indicated by `bit_mask` are set.*
- uint8\_t [OSFlagPendAllNoWait](#) ([OS\\_FLAGS](#) \*flags, uint32\_t bit\_mask)
 

*This function immediately checks to see if **all** the flag bits indicated by `bit_mask` are set; it does not wait.*
- uint32\_t [OSFlagState](#) ([OS\\_FLAGS](#) \*flags)
 

*This function returns the current values of the flags stored in the [OS\\_FLAGS](#) object structure.*
- uint8\_t [OSTaskCreatewName](#) (void(\*task)(void \*dptr), void \*data, void \*pstktop, void \*pstkbot, uint8\_t prio, const char \*name)
 

*Create a new task.*
- void [OSTimeWaitUntil](#) (uint32\_t systemTickValue)
 

*Delay the task until the specified value of the system timer tick. The number of system ticks per second is defined by the constant: `TICKS_PER_SECOND` in `<nburn_install>/nbrtos/include/constants.h`. The default value is 20 ticks per second.*
- void [OSTimeDly](#) (uint32\_t to\_count)
 

*Delay the task until the specified value of the system timer ticks. The number of system ticks per second is defined by the constant: `TICKS_PER_SECOND` in `<nburn_install>/nbrtos/include/constants.h`. The default value is 20 ticks per second.*
- void [OSTaskDelete](#) (void)
 

*This function deletes the current calling task, but we do not recommend the use of this function because it can cause memory leaks.*
- uint8\_t [OSChangePrio](#) (uint32\_t newp)
 

*Set the priority of the calling task.*
- void [OSSetName](#) (const char \*cp)
 

*Set the name of the calling task.*
- void [OSLock](#) (void)
 

*Calling the [OSLock](#) function will prevent the OS from changing tasks.*
- void [OSUnlock](#) (void)
 

*This function unlocks the OS.*
- uint8\_t [OSSemInit](#) ([OS\\_SEM](#) \*psem, long value)
 

*Initializes a semaphore.*
- uint8\_t [OSSemPost](#) ([OS\\_SEM](#) \*psem)
 

*Increases the value of the semaphore by one. **Note:** If any higher priority tasks were waiting on the semaphore - it releases them.*
- uint8\_t [OSSemPend](#) ([OS\\_SEM](#) \*psem, uint16\_t timeout)
 

*Wait timeout ticks for the value of the semaphore to be non zero. **Note:** A timeout value of 0 (zero) waits forever.*
- uint8\_t [OSSemPendNoWait](#) ([OS\\_SEM](#) \*psem)
 

*[OSSemPendNoWait\(\)](#) is identical to [OSSemPend\(\)](#), but it does not wait.*
- uint8\_t [OSMboxInit](#) ([OS\\_MBOX](#) \*pmbox, void \*msg)
 

*This function is used to initialize an [OS\\_MBOX](#) structure.*
- uint8\_t [OSMboxPost](#) ([OS\\_MBOX](#) \*pmbox, void \*msg)
 

*This function posts a message to a Mail box.*
- void \* [OSMboxPend](#) ([OS\\_MBOX](#) \*pmbox, uint16\_t timeout, uint8\_t \*err)

- Wait timeout ticks for some other task to post to the Mailbox.*

  - void \* **OSMboxPendNoWait** (OS\_MBOX \*pmbbox, uint8\_t \*err)  
*OSMboxPendNoWait() is identical to OSMboxPend(), but it does **not** wait.*
- uint8\_t **OSQInit** (OS\_Q \*pq, void \*\*start, uint8\_t size)  
*A queue functions as a fixed size FIFO for communication between tasks. This function initializes an OS\_Q structure.*
- uint8\_t **OSQPost** (OS\_Q \*pq, void \*msg)  
*This function posts a message to a Queue.*
- uint8\_t **OSQPostFirst** (OS\_Q \*pq, void \*msg)  
*This function posts a message like OSQPost, but posts the message at the head of the queue.*
- uint8\_t **OSQPostUnique** (OS\_Q \*pq, void \*msg)  
*This function posts a message like OSQPost, but only if the message isn't already in the queue The function performs a brute force check to see if the message is already in the queue.*
- uint8\_t **OSQPostUniqueFirst** (OS\_Q \*pq, void \*msg)  
*This function posts a message like OSQPostFirst, but only if the message isn't already in the queue The function performs a brute force check to see if the message is already in the queue.*
- void \* **OSQPend** (OS\_Q \*pq, uint16\_t timeout, uint8\_t \*err)  
*Wait timeout ticks for another task to post to the queue.*
- void \* **OSQPendNoWait** (OS\_Q \*pq, uint8\_t \*err)  
*OSQPendNoWait() is identical to the OSQPend() function but it does not wait.*
- uint8\_t **OSFifoInit** (OS\_FIFO \*pFifo)  
*Initialize a FIFO, which is used to pass structures from one task to another.*
- uint8\_t **OSFifoPost** (OS\_FIFO \*pFifo, OS\_FIFO\_EL \*pToPost)  
*This function posts to a FIFO.*
- uint8\_t **OSFifoPostFirst** (OS\_FIFO \*pFifo, OS\_FIFO\_EL \*pToPost)  
*This function is identical to OSFifoPost(), but the element posted is put at the beginning of the FIFO list.*
- OS\_FIFO\_EL \* **OSFifoPend** (OS\_FIFO \*pFifo, uint16\_t timeout)  
*This function pends on a FIFO.*
- OS\_FIFO\_EL \* **OSFifoPendNoWait** (OS\_FIFO \*pFifo)  
*This function is identical to the OSFifoPen() function, but it does **not** wait.*
- uint8\_t **OSCritInit** (OS\_CRIT \*pCrit)  
*This function initializes the critical section.*
- uint8\_t **OSCritEnter** (OS\_CRIT \*pCrit, uint16\_t timeout)  
*This function tries to enter or claim the critical section.*
- uint8\_t **OSCritEnterNoWait** (OS\_CRIT \*pCrit)  
*This function tries to enter or claim the critical section.*
- uint8\_t **OSCritLeave** (OS\_CRIT \*pCrit)  
*This function releases the critical section.*
- uint8\_t **OSTaskID** (void)  
*Returns the current task's priority.*
- const char \* **OSTaskName** ()  
*Returns the current task's name.*
- void **OSChangeTaskDly** (uint16\_t task\_prio, uint32\_t to\_count)  
*This function allows the User to modify the timeout delay for a task that is waiting.*
- void **OSDumpStack** (void)  
*Dump the task stack to the stdout.*
- void **OSDumpTCBStacks** (void)  
*This function dumps information about the UCOS stacks and tasks to stdout. This function is useful for debugging.*
- void **OSDumpTasks** (void)  
*Dump the state and call stack for every task to stdout. This function is useful for debugging.*
- void **OSStartTaskDumper** (uint8\_t prio, uint32\_t reportInterval)  
*This function creates a task that calls OSDumpTasks() at the specified system time tick interval. The task is intended for use when debugging run status of multiple tasks.*
- void **ShowTaskList** (void)  
*This functions dumps the current RTOS task states to stdio.*

## 17.446.1 Detailed Description

NetBurner Real-Time Operating System (NBRTOS) API.

```

## Classes

- class [NBString](#)

*Lightweight alternative to C++ CString class.*

### 17.449.1 Detailed Description

NetBurner String Class.

A lightweight alternative to the C++ CString class. Note that if you prefer CString, you can add it using the Standard Template Library (STL), but the STL consumes a significant amount of resources.

## 17.451 nbtime.h File Reference

NetBurner Time Header File.

```

#include <servlets.h>
#include <config_obj.h>
#include <nbstring.h>
#include <nettimer.h>
#include <time.h>

```

### Functions

- `time_t set_time` (time\_t time\_to\_set, uint32\_t fraction=0)  
*Set the system time to the value passed in the time\_t parameter.*
- `time_t timegm` (struct tm \*bts)  
*Returns the value of type time\_t that represents the GMT time described by the tm structure pointed by bts.*
- `void tzsetchar` (const char \*tzenv)  
*Set the system local time.*

### Classes

- class [InterfaceBlock](#)  
*Network interface configuration block class for interface control and configuration.*

### Functions

- int [Removeinterface](#) (int interface)  
*Remove a network interface from the system.*

- void [EnableMulticast](#) ([MACADR](#) macAddress, int interface=0)  
*Enable Multicast on an existing interface.*
- void [DisableMulticast](#) ([MACADR](#) macAddress, int interface=0)  
*Disable Multicast on an existing interface.*
- [InterfaceBlock](#) \* [GetInterfaceBlock](#) (int interface=0)  
*Get an [InterfaceBlock](#) control and configuration object.*
- int32\_t [GetFirstInterface](#) (void)  
*Returns the Interface Number of the first registered network interface.*
- int32\_t [GetNextInterface](#) (int lastInterface)  
*Returns the Interface Number of the next registered network interface.*
- int32\_t [GetInterfaceNumber](#) ([InterfaceBlock](#) \*pifb)  
*Returns the Interface Number of the specified network interface [InterfaceBlock](#).*
- int32\_t [GetInterfaceForMyAddress4](#) ([IPADDR4](#) ip)  
*Returns the Interface Number of the specified network interface IPv4 address.*
- bool [GetInterfaceLink](#) (int ifn)  
*Returns the network interface link status.*
- [MACADR](#) [InterfaceMAC](#) (int interface)  
*Returns the MAC address of the specified network interface.*
- bool [InterfaceLinkActive](#) (int interface)  
*Returns the link status of the specified network interface.*
- int [InterfaceLinkSpeed](#) (int interface)  
*Returns the 10/100 link speed of the specified network interface.*
- bool [InterfaceLinkDuplex](#) (int interface)  
*Returns the full or half link duplex of the specified network interface.*
- const char \* [InterfaceName](#) (int interface)  
*Returns the interface name of the specified network interface.*
- [IPADDR4](#) [InterfaceIP](#) (int interface)  
*Returns the IPv4 IP address of the specified network interface.*
- [IPADDR4](#) [InterfaceAutoIP](#) (int interface)  
*Returns the IPv4 IP AutoIP address of the specified network interface.*
- [IPADDR4](#) [InterfaceDNS](#) (int interface)  
*Returns the IPv4 DNS address of the specified network interface.*
- [IPADDR4](#) [InterfaceDNS2](#) (int interface)  
*Returns the second IPv4 DNS address of the specified network interface.*
- [IPADDR4](#) [InterfaceMASK](#) (int interface)  
*Returns the IPv4 network mask of the specified network interface.*
- [IPADDR4](#) [InterfaceGate](#) (int interface)  
*Returns the IPv4 gateway address of the specified network interface.*

### 17.457.1 Detailed Description

NetBurner Network Interface Header File.

All network interfaces and functions are accessed through the network interface API including:

- Ethernet
- Wifi
- AutoIP
- Multihome
- PPP

## 17.458 netinterface.h

```

```

00119
00120 Process Internet Protocol Packet (IP)
00121
00122 Parameters:
00123 poolPtr - Packet from pool
00124 ethernetFramePtr - Ethernet frame
00125 checksum - IP frame checksum
00126
00127 Return:
00128 None
00129
00130 Notes;
00131 Called for every IP packet received and meets this criteria.
00132 1)The packet is an IP packet.
00133 2)The IP header checksum is valid.
00134 3)The packet was addressed to us or to a broadcast address.
00135 Before the callback is called the flags member of the buffer is setup to
00136 indicate physical broadcast etc....
00137
00138 *****
00139 */
00140 typedef void(ProcessPacketFunc)(PoolPtr poolPtr, PEFRAME ethernetFramePtr, uint16_t checksum);
00141
00142 /*
00143 *****
00144 Process Address Resolution Packet (ARP)
00145
00146 Parameters:
00147 poolPtr - Packet from pool
00148 ethernetFramePtr - Ethernet frame
00149
00150 Return:
00151 None
00152
00153 Notes;
00154 Called for every ARP packet received. Before the callback is called the
00155 flags member of the buffer is setup to indicate physical broadcast etc...

## 17.459 netrx.h File Reference

Header file for callback functions to add custom Ethernet handlers and pass Ethernet frames in the bottom of the TCP/IP stack.

```

#include <predef.h>
#include <buffers.h>

```

### Typedefs

- typedef int(\* [netDoRXFunc](#)) (PoolPtr, uint16\_t, int)  
*Typedef interface for all network rx processing functions.*

### Functions

- [netDoRXFunc SetCustomNetDoRX](#) ([netDoRXFunc](#) customFunc)  
*Registers a new custom ethernet handler to run prior to the primary handler.*
- [netDoRXFunc ClearCustomNetDoRX](#) ()  
*Clears the custom ethernet handler, resetting the handler to NULL.*
- int [NetDoRX](#) (PoolPtr pp, uint16\_t ocount, int if\_num)  
*Entry function for Ethernet frames into the system TCP/IP stack.*

### 17.459.1 Detailed Description

Header file for callback functions to add custom Ethernet handlers and pass Ethernet frames in the bottom of the TCP/IP stack.

00026 *****
00027 *
00028 * Debugging
00029 *
00030 * Use these constants to turn debug features on and off
00031 * NBRTOS_STACKCHECK - Stack integrity
00032 * NBRTOS_STACKOVERFLOW - Real time stack overflow protection
00033 * * Reduces all stack sizes by 256 bytes, creating
00034 * a canary zone which will be watched for writes
00035 * * Use compiler option -fstack-check
00036 * * Enable in application with EnableOSStackProtector()
00037 * * Coldfire modules can enable either overflow or underflow checking
00038 * * ARM modules can enable both overflow and underflow checking
00039 simultaneously
00040 * NBRTOS_STACKUNDERFLOW - Real time stack underflow protection
00041 * * Reduces all stack sizes by 256 bytes, creating
00042 * a canary zone which will be watched for writes
00043 * * Use compiler option -fstack-check
00044 * * Enable in application with EnableOSStackProtector()
00045 * * Coldfire modules can enable either overflow or underflow checking
00046 simultaneously
00046 * NBRTOS_TASKLIST - Task diagnostics
00047 * NBRTOS_TASK_LOG - Task change callback with new prio, IRQ context.
00048 * NBRTOS_TIME - Task time counting
00049 * BUFFER_WATERMARK - Remember Buffer hi and low watermarks.
00050 * BUFFER_DIAG - Buffer integrity and use

```

```

00051 * BUFFER_DIAG_LOG - Buffer integrity and use logging, via SysLog
00052 * BUFFER_SANITY - Buffer Pool sanity traps
00053 * USER_CRITICAL_SANITY - Enables an assert if an illegal pend occurs within a
USER_ENTER_CRITICAL() block
00054 * _DEBUG_PRINT - Enables DBPRINT Macros in release builds
00055 * ENABLE_SMARTTRAP - Enables extra debugging information during traps

```

```

00071 *****
00072 *
00073 * Queued Serial Peripheral Interface (QSPI)
00074 *
00075 * Interface consists of data output (QSPI_DOUT), data input (QSPI_DIN),
00076 * serial clock (QSPI_CLK) & peripheral chip selects (QSPI_CS[3:0]).
00077 *
00078 * SPI parameters are used to match the master (processor) with the slave
00079 * device. Chip select can be used to multiplex devices.
00080 *
00081 * The specific hardware initialization for MFCXXXX and MODXXXX are
00082 * microprocessor and module specific and need to be correctly
00083 * implemented in the module specific library for each SPI device.
00084 *
00085 * More than one SPI device requires careful coordination of hardware use
00086 * and synchronization of use.
00087 *

00009 *****
00010 *
00011 * Queued Serial Peripheral Interface (QSPI)
00012 *
00013 * Interface consists of data output (QSPI_DOUT), data input (QSPI_DIN),
00014 * serial clock (QSPI_CLK) & optionally peripheral chip selects
00015 * (QSPI_CS[3:0]).
00016 *
00017 * SPI parameters are used to match the master (processor) with the slave
00018 * device. Chip select can be used to multiplex devices.
00019 *
00020 * The specific hardware initialization for MFCXXXX and MODXXXX are
00021 * microprocessor and module specific and need to be correctly
00022 * implemented in the module specific library for each SPI device, for
00023 * example Nburn\MOD5270\system\wifi70_bsp.cpp.
00024 *
00025 * More than one SPI device requires careful coordination of hardware use
00026 * and synchronization of use.

### Enumerations

- enum **SocksAuthType** : unsigned char { **eSocksAuthTypeGssApi** = 0x01 , **eSocksAuthTypeUnPw** = 0x02 , **eSocksAuthTypeNoAuth** = 0x04 }
- SOCKS Authorization Types.*
- enum **SocksClientCmd** : unsigned char { **eSocksClientCmdConnect** = 1 , **eSocksClientCmdBind** = 2 , **eSocksClientCmdUdpAssoc** = 3 }
- SOCKS Client Commands.*
- enum **SocksAdrType** : unsigned char { **eSocksAdrTypeNone** = 0x00 , **eSocksAdrTypeIpv4** = 0x01 , **eSocksAdrTypeDomain** = 0x03 , **eSocksAdrTypeIpv6** = 0x04 }
- SOCKS Address Types.*

### Functions

- bool **AuthWithGssApi** ()  
*A weak function that should be overridden by the developer in order to support GSSAPI authorization.*
- void **SetSocksProxySettings** (SocksProxy \*socksProxy)  
*Set the system level SOCKS proxy settings object to the one that is passed in. If this object is set and is marked as enabled, calls to CoreConnect() (made from connect(), DoGet(), etc), will all initially connect to the proxy server using the SOCKS5 protocol.*
- SocksProxy \* **GetSocksProxySettings** ()  
*Get a pointer to the currently set Socks proxy settings object.*

### 17.513.1 Detailed Description

Read an Application File from an Input Stream.

Functions to read an application form a source with a file descriptor. Useful for programming/updating an application image from sources such as flash memory cards, posts from other devices, and files received from FTP.

## 17.514 StreamUpdate.h

*Create a file descriptor for a TCP connection and return immediately. This function does not wait for a connection to be established. Before using the file descriptor, the application must verify the connection was successful with `TcpGetSocketState(fd)`. The state will be `TCP_STATE_ESTABLISHED` when the connection has been successfully established. Note: The connection status can also be obtained with the `wireavail()` function.*
- int [NoBlockConnectwlocal](#) (const [IPADDR](#) &ipAddress, uint16\_t localPort, uint16\_t remotePort, [IPADDR](#) interfacelpAddress=IPADDR::NullIP(), int ifn=-1)
 

*Create a file descriptor for a TCP connection and return immediately. This function does not wait for a connection to be established. Before using the file descriptor, the application must verify the connection was successful with `TcpGetSocketState(fd)`. The state will be `TCP_STATE_ESTABLISHED` when the connection has been successfully established. Note: The connection status can also be obtained with the `wireavail()` function.*
- [IPADDR GetSocketRemoteAddr](#) (int fd)
 

*Returns the IP address of the remote host associated with the specified file descriptor.*
- [IPADDR GetSocketLocalAddr](#) (int fd)
 

*Returns the IP address of the local interface associated with the connection.*
- uint16\_t [GetSocketRemotePort](#) (int fd)
 

*Returns the port number of the remote host associated with the connection.*
- uint16\_t [GetSocketLocalPort](#) (int fd)
 

*Returns the local port number associated with the connection.*
- uint32\_t [TcpGetLastRxTime](#) (int fd)
 

*Returns the value of system Time Ticks when the last packet was received. Used for the TCP Keep Alive feature.*
- void [TcpSendKeepAlive](#) (int fd)
 

*Send a TCP keep alive packet to a remote host.*
- uint32\_t [TcpGetLastRxInterval](#) (int fd)
 

*Returns the number of system Time Ticks since the last packet was received. This is the difference between the current system time and `lastRxTime` of the socket.*
- int [GetTcpRtxCount](#) (int fd)
 

*Returns the number of re-transmits that have occurred on the specified connection.*
- uint8\_t [SetOutOfOrderBuffers](#) (int fd, uint8\_t max)

- Set the maximum number of out-of-order TCP buffers for the specified TCP socket.*

  - int [setsockopt](#) (int fd, int option)

*Set TCP socket options.*
- int [clrsockopt](#) (int fd, int option)

*Clear TCP socket options.*
- int [getsockopt](#) (int fd)

*Returns the options for the specified TCP socket.*
- int [SetSocketUnackBuffers](#) (int fd, uint8\_t val)

*Set the maximum number of outbound TCP buffers in the transmit un-acknowledged list for the specified TCP socket.*
- int [SetSocketRxBuffers](#) (int fd, int n)

*Set the number of TCP receive buffers for the specified TCP socket.*
- int [SetSocketTxBuffers](#) (int fd, int n)

*Set the number of TCP transmit buffers for the specified TCP socket.*
- int [abortsocket](#) (int fd)

*Execute an abort on the specified TCP socket.*
- int [SockReadWithTimeout](#) (int fd, char \*buf, int nbytes, uint32\_t timeout)

*Attempt to read from a TCP socket until the timeout expires.*
- char [SocketPeek](#) (int fd)

*Returns the next char that would be read, 0 if no data.*
- int [TcpGetSocketInterface](#) (int fd)

*Return the network interface associated with a TCP socket.*
- uint8\_t [TcpGetSocketState](#) (int fd)

*Return the current state of a TCP socket.*
- uint16\_t [TcpGetRxBufferSpaceUsed](#) (int fd)

*Returns the number of bytes used in a socket's RX buffer.*
- uint16\_t [TcpGetTxBufferAvailSpace](#) (int fd)

*Returns the number of bytes available in a socket's TX buffer.*
- uint16\_t [TcpGetTxDataWaiting](#) (int fd)

*Returns the number of bytes waiting to be sent in a socket's TX Buffer.*
- BOOL [TcpAllDataAcked](#) (int socket)

*Check the data acknowledged state of a socket.*
- BOOL [WaitForSocketFlush](#) (int fd, uint32\_t ticks)

*Wait for a socket flush operation to complete. A socket is flushed if all sent data has been acknowledged.*
- void [RegisterTCPReadNotify](#) (int tcpFd, tcp\_notify\_handler \*notifyHandler)

*Register a TCP socket and callback function for read notifications.*
- void [RegisterTCPWriteNotify](#) (int tcpFd, tcp\_notify\_handler \*notifyHandler)

*Register a TCP socket and callback function for write notifications.*

### 17.519.1 Detailed Description

NetBurner TCP API.

## 17.520 tcp.h

```

### Macros

- **#define WEB\_CLIENT\_ERROR\_NO\_ETHERNET (1)**  
*No Ethernet connection.*
- **#define WEB\_CLIENT\_ERROR\_NO\_ADDRESS (2)**  
*Interface has no IP address.*
- **#define WEB\_CLIENT\_ERROR\_NO\_GATEWAY (3)**  
*Interface has no gateway IP address.*
- **#define WEB\_CLIENT\_ERROR\_GATEWAY\_WRONG (4)**  
*Interface has incorrect gateway IP address.*
- **#define WEB\_CLIENT\_ERROR\_NO\_DNS\_ADDR (5)**  
*Interface has a DNS error.*
- **#define WEB\_CLIENT\_ERROR\_NO\_DNS\_RESOLVE (6)**  
*DNS was not able to resolve the URL name.*
- **#define WEB\_CLIENT\_ERROR\_NO\_NTP (7)**  
*NTP failed.*
- **#define WEB\_CLIENT\_ERROR\_NO\_SERVER\_RESPONSE (8)**  
*No response from server.*
- **#define WEB\_CLIENT\_ERROR\_NO\_SERVER\_CONNECT (9)**  
*Unable to connect to server.*
- **#define WEB\_CLIENT\_ERROR\_NO\_ERROR (10)**  
*No error.*

### Functions

- bool [DoActualClientRequest](#) ([ParsedURI](#) &TheUri, uint16\_t &next\_time\_delay)  
*Callback to specify for performing and handle a WebClient request.*
- bool [StartWebClient](#) (int prio, const char \*url1, const char \*url2=NULL, bool bDoNtp=false)  
*Start the web client using a URL string.*
- bool [StartWebClient](#) (int prio, const [NBString](#) &url1, const [NBString](#) &url2, bool bDoNtp=false)  
*Start the web client using a [NBString](#).*
- bool [StartWebClient](#) (int prio, const [NBString](#) &url1, bool bDoNtp=false)  
*Start the web client using a [NBString](#).*

## Variables

- `WebErrorReporterFunc * pWebErrorReporter`

*Set this variable to a callback function to specify a handler for errors.*

## 17.532.1 Detailed Description

Web Client.

## 17.535 MOD5441X/include/bsp.h File Reference

Low level hardware functions for the MOD5441x platform.

### Functions

- void [SpreadSpectrumOscillator](#) (bool enable)  
*Enable spread spectrum oscialltor mode on the CPU clock.*

### 17.535.1 Detailed Description

Low level hardware functions for the MOD5441x platform.

### 17.535.2 Function Documentation

#### 17.535.2.1 SpreadSpectrumOscillator()

```
void SpreadSpectrumOscillator (
 bool enable)
```

Enable spread spectrum oscialltor mode on the CPU clock.

The 25MHz CPU oscillator defaults to standard mode, but can be put in a spread spectrum mode that will help with radiated emissions. This will reduce EMI, but will cause the clock to have some jitter.

When enabled, the oscillator center frequency is reduced by 2% to avoid overclocking the CPU. The frequency will then vary by +/- 2%. This means the average clock rate will be reduced by 1% when this feature is enabled. To compensate, the system CPU\_CLOCK variable and system time tick rate are modified to reflect the new bus clock speed. Finally, the console/debug serial port will be closed and reopened to recalculate the baud rate.

### Warning

Any peripherals or clock dependent sections of your application must take this adjustment into consideration. We recommend calling this function in the very beginning of the application to avoid baud rate miscalculations.

### Parameters

|                     |                                            |
|---------------------|--------------------------------------------|
| <code>enable</code> | Set to true to enable spread spectrum mode |
|---------------------|--------------------------------------------|

## 17.537.1 Detailed Description

Hardware functions that are unique to a specific platform.

## 17.537.2 Function Documentation

### 17.537.2.1 DrivePCK()

```
void DrivePCK (
 uint8_t prescaler = 1,
 uint8_t clkSource = PMC_PCK_CSS_MCK)
```

Enables external CPU clock signal on J1[31].

#### Parameters

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>prescaler</i> | The prescaler to apply to the clock source PCK generation              |
| <i>clkSource</i> | The clock source used to generate the PCK clock. See pmc.h for options |

### 17.537.2.2 EnableExtBusBuff()

```
void EnableExtBusBuff (
 bool enable)
```

Enable External Bus Interface Buffers.

When enabled the following signals will always be driven as outputs on the P1 header: A0/NSB0, A2, A3, A4, A5, A6, A7, A8, A9, A10, A11, A13, A14, A16/BA0, NSB1 The data buffer is driven when the TIP signal is active, which is also dependant on this function to be enabled. When enabled the following signals will be driven in the direction controlled by the NRD EBI signal: D0-D15

When disabled, all buffered signals on the P1 header will be HiZ. This will reduce EMI, power consumption and allow for NRD to be used as a GPIO

#### Parameters

|               |                                     |
|---------------|-------------------------------------|
| <i>enable</i> | true to enable external bus buffers |
|---------------|-------------------------------------|

### 17.537.2.3 SetMCKDivider()

```
uint32_t SetMCKDivider (
 uint8_t divider)
```

Sets Master Clock prescaler (PRES) in the MCKR register to adjust system clock speed. Primarily used for power reduction.

**Please refer to the ATSAME70 processor reference manual Clock Generator chapter for complete limitations of setting the PLL to avoid potentially damaging the processor**

The calculation used to determine CPU speed is:  $\text{CPU\_CLOCK} = (\text{OSC\_CLOCK} * \text{PLL multiplier}) / \text{divider (PRES)}$

The default MODM7AE70 module has a default PLL speed (  $\text{OSC\_CLOCK} * \text{PLL multiplier}$  ) of 300MHz

- Configurations handled by this function
  1. Adjusts prescaler for Master Clk in the MCKR register
  2. If new CPU Clock is 150MHz or LOWER then the Peripheral to CPU Clock ratio is set to 1:1
  3. Sets new CPU\_CLOCK and PERIPH\_CLOCK variables  
These are used in many baud rate calculations in NetBurner API, for example serial ports
  4. Reinitializes the system tick so TimeTicks are accurate
  5. Adjusts Flash memory timings
  6. Adjust SDRAM refresh timings
  7. Closes and reopens default serial port to adjust baud

## Parameters

|                |                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>divider</i> | Divider for CPU_CLOCK calculation. Sets PRES variable in MCKR register. Only 1,2,3,4,8,16,32,64 are valid, other values have no affect. |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|

## Returns

The current CPU clock frequency

## 17.537.2.4 SetPLL()

```
uint32_t SetPLL (
 uint8_t multiplier)
```

Sets PLL to adjust system clock speed, primarily used for power reduction.

**Please refer to the ATSAME70 processor reference manual Clock Generator chapter for complete limitations of setting the PLL to avoid potentially damaging the processor**

The calculation used to determine CPU speed is: CPU\_CLOCK = OSC\_CLOCK \* mult The default MODM7AE70 module has a 12000000hz OSC\_CLOCK The function will do nothing if new frequency is >300MHz or <160Mhz due to electrical specifications The only exception to this rule is setting the PLL multiplier to 1 or 0 which will disable it

- Configurations handled by this function
  1. Adjusts PLL configurations for Main Clk
  2. Sets CPU\_CLOCK and PERIPH\_CLOCK variables  
These are used in many baud rate calculations in NetBurner API, for example serial ports
  3. Reinitializes the system tick so TimeTicks are accurate
  4. Adjusts Flash memory timings
  5. Adjust SDRAM refresh timings
  6. Closes and reopens default serial port to adjust baud

## Parameters

|                   |                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------|
| <i>multiplier</i> | Multiplier for CPU_CLOCK calculation. Only 0,1,14-25 are valid. Set to 1 or 0 to disable PLL |
|-------------------|----------------------------------------------------------------------------------------------|

## Returns

The current CPU clock frequency

### 17.539.1 Detailed Description

Hardware functions that are unique to a specific platform.

## 17.539.2 Function Documentation

### 17.539.2.1 DrivePCK()

```
void DrivePCK (
 uint8_t prescaler = 1,
 uint8_t clkSource = PMC_PCK_CSS_MCK)
```

Enables external CPU clock signal on J1[31].

#### Parameters

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>prescaler</i> | The prescaler to apply to the clock source PCK generation              |
| <i>clkSource</i> | The clock source used to generate the PCK clock. See pmc.h for options |

### 17.539.2.2 EnableExtBusBuff()

```
void EnableExtBusBuff (
 bool enable)
```

Enable External Bus Interface Buffers.

When enabled the following signals will always be driven as outputs on the P1 header: A0/NSB0, A2, A3, A4, A5, A6, A7, A8, A9, A10, A11, A13, A14, A16/BA0, NSB1 The data buffer is driven when the TIP signal is active, which is also dependant on this function to be enabled. When enabled the following signals will be driven in the direction controlled by the NRD EBI signal: D0-D15

When disabled, all buffered signals on the P1 header will be HiZ. This will reduce EMI, power consumption and allow for NRD to be used as a GPIO

#### Parameters

|               |                                     |
|---------------|-------------------------------------|
| <i>enable</i> | true to enable external bus buffers |
|---------------|-------------------------------------|

### 17.539.2.3 SetMCKDivider()

```
uint32_t SetMCKDivider (
 uint8_t divider)
```

Sets Master Clock prescaler (PRES) in the MCKR register to adjust system clock speed. Primarily used for power reduction.

**Please refer to the ATSAME70 processor reference manual Clock Generator chapter for complete limitations of setting the PLL to avoid potentially damaging the processor**

The calculation used to determine CPU speed is: CPU\_CLOCK = ( OSC\_CLOCK \* PLL multiplier ) / divider (PRES)  
The default SBE70LC module has a default PLL speed ( OSC\_CLOCK \* PLL multiplier ) of 300MHz

- Configurations handled by this function
  1. Adjusts prescaler for Master Clk in the MCKR register
  2. If new CPU Clock is 150MHz or LOWER then the Peripheral to CPU Clock ratio is set to 1:1
  3. Sets new CPU\_CLOCK and PERIPH\_CLOCK variables  
These are used in many baud rate calculations in NetBurner API, for example serial ports
  4. Reinitializes the system tick so TimeTicks are accurate
  5. Adjusts Flash memory timings
  6. Adjust SDRAM refresh timings
  7. Closes and reopens default serial port to adjust baud

## Parameters

|                |                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>divider</i> | Divider for CPU_CLOCK calculation. Sets PRES variable in MCKR register. Only 1,2,3,4,8,16,32,64 are valid, other values have no affect. |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|

## Returns

The current CPU clock frequency

## 17.539.2.4 SetPLL()

```
uint32_t SetPLL (
 uint8_t multiplier)
```

Sets PLL to adjust system clock speed, primarily used for power reduction.

**Please refer to the ATSAME70 processor reference manual Clock Generator chapter for complete limitations of setting the PLL to avoid potentially damaging the processor**

The calculation used to determine CPU speed is: CPU\_CLOCK = OSC\_CLOCK \* mult The default SBE70LCV module has a 12000000hz OSC\_CLOCK The function will do nothing if new frequency is >300MHz or <160Mhz due to electrical specifications The only exception to this rule is setting the PLL multiplier to 1 or 0 which will disable it

- Configurations handled by this function
  1. Adjusts PLL configurations for Main Clk
  2. Sets CPU\_CLOCK and PERIPH\_CLOCK variables  
These are used in many baud rate calculations in NetBurner API, for example serial ports
  3. Reinitializes the system tick so TimeTicks are accurate
  4. Adjusts Flash memory timings
  5. Adjust SDRAM refresh timings
  6. Closes and reopens default serial port to adjust baud

## Parameters

|                   |                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------|
| <i>multiplier</i> | Multiplier for CPU_CLOCK calculation. Only 0,1,14-25 are valid. Set to 1 or 0 to disable PLL |
|-------------------|----------------------------------------------------------------------------------------------|

## Returns

The current CPU clock frequency

00013 */
00014
00015 /* Notice extracted from xxHash homepage :
00016
00017 xxHash is an extremely fast Hash algorithm, running at RAM speed limits.
00018 It also successfully passes all tests from the SMHasher suite.
00019
00020 Comparison (single thread, Windows Seven 32 bits, using SMHasher on a Core 2 Duo @3GHz)
00021
00022 Name Speed Q.Score Author
00023 xxHash 5.4 GB/s 10
00024 CrapWow 3.2 GB/s 2 Andrew
00025 MumurHash 3a 2.7 GB/s 10 Austin Appleby
00026 SpookyHash 2.0 GB/s 10 Bob Jenkins
00027 SBox 1.4 GB/s 9 Bret Mulvey

```

```

00028 Lookup3 1.2 GB/s 9 Bob Jenkins
00029 SuperFastHash 1.2 GB/s 1 Paul Hsieh
00030 CityHash64 1.05 GB/s 10 Pike & Alakuijala
00031 FNV 0.55 GB/s 5 Fowler, Noll, Vo
00032 CRC32 0.43 GB/s 9
00033 MD5-32 0.33 GB/s 10 Ronald L. Rivest
00034 SHA1-32 0.28 GB/s 10
00035
00036 Q.Score is a measure of quality of the hash function.
00037 It depends on successfully passing SMHasher test set.
00038 10 is a perfect score.
00039
00040 A 64-bits version, named XXH64, is available since r35.
00041 It offers much better speed, but for 64-bits applications only.
00042 Name Speed on 64 bits Speed on 32 bits
00043 XXH64 13.8 GB/s 1.9 GB/s
00044 XXH32 6.8 GB/s 6.0 GB/s

00185 /*
00186 These functions generate the xxHash of an input provided in multiple segments.
00187 Note that, for small input, they are slower than single-call functions, due to state management.
00188 For small input, prefer `XXH32()` and `XXH64()` .
00189
00190 XXH state must first be allocated, using XXH*_createState() .
00191
00192 Start a new hash by initializing state with a seed, using XXH*_reset().
00193
00194 Then, feed the hash state by calling XXH*_update() as many times as necessary.
00195 Obviously, input must be allocated and read accessible.
00196 The function returns an error code, with 0 meaning OK, and any other value meaning there is an error.
00197
00198 Finally, a hash value can be produced anytime, by using XXH*_digest().
00199 This function returns the nn-bits hash as an int or long long.
00200
00201 It's still possible to continue inserting input into the hash state after a digest,
00202 and generate some new hashes later on, by calling again XXH*_digest().
00203
00204 When done, free XXH state space if it was allocated dynamically.
