[EnableMulticast\(MACADR macAddress, int interface\)](#), [DisableMulticast\(\)](#)

### 16.96.3.2 GetInterfaceName()

```
virtual const char * InterfaceBlock::GetInterfaceName () [virtual]
```

Returns the interface name network interface.

#### Returns

Pointer to a character string containing the name of the network interface

#### See also

[InterfaceName\(\)](#)

### 16.96.3.3 GetInterfaceNumber()

```
int InterfaceBlock::GetInterfaceNumber () [inline]
```

Returns the Interface Number of the network interface.

#### Returns

Interface number of the [InterfaceBlock](#).

#### See also

[GetInterfaceNumber\(InterfaceBlock \\*pifb\)](#)

### 16.96.3.4 InterfaceLinkChange()

```
void InterfaceBlock::InterfaceLinkChange (
 bool link)
```

Change the link status of the network interface.

#### Parameters

|             |                                         |
|-------------|-----------------------------------------|
| <i>link</i> | Set link active status to true or false |
|-------------|-----------------------------------------|

### 16.96.3.5 IsRootInterface()

```
bool InterfaceBlock::IsRootInterface () [inline]
```

Returns true if this is the first interface in the interface list.

#### Returns

True if this is the first interface in the interface list, otherwise false

### 16.96.3.6 LinkActive()

```
virtual bool InterfaceBlock::LinkActive () [pure virtual]
```

Returns the link status of the network interface.

#### Returns

True if link is active, otherwise false

#### See also

[GetInterfaceLink\(\)](#), [InterfaceLinkActive\(\)](#)

### 16.96.3.7 LinkDuplex()

```
virtual bool InterfaceBlock::LinkDuplex () [pure virtual]
```

Returns the full or half link duplex of the network interface.

#### Returns

True if full duplex, false if half duplex

#### See also

[InterfaceLinkDuplex\(\)](#)

### 16.96.3.8 LinkSpeed()

```
virtual int InterfaceBlock::LinkSpeed () [pure virtual]
```

Returns the link speed of the network interface.

#### Returns

10, 100, or 1000, representing the Mbps speed

#### See also

[InterfaceLinkSpeed\(\)](#)

### 16.96.3.9 RegisterInterface()

```
void InterfaceBlock::RegisterInterface ()
```

Register a network interface with system.

[InterfaceBlock](#) member function to register a new network interface

#### See also

[Removeinterface\(\)](#), [EnableMulticast\(\)](#), [DisableMulticast\(\)](#)

## 16.97.1 Detailed Description

Used to store and manipulate IPv4 addresses in dual stack mode.

It is recommended to use the IPADDR object, which can hold either an IPv4 or IPv6 address, rather than explicitly specifying IPv4.

## 16.97.2 Constructor & Destructor Documentation

### 16.97.2.1 IPADDR4()

```
IPADDR4::IPADDR4 (
 const IPADDR4 & v) [default]
```

Constructor to create an IPv4 object initialized to to the specified [IPADDR4](#) IP address.

#### Parameters

|          |                                                         |
|----------|---------------------------------------------------------|
| <i>v</i> | <a href="#">IPADDR4</a> object used for initialization. |
|----------|---------------------------------------------------------|

## 16.97.3 Member Function Documentation

### 16.97.3.1 fdprint()

```
void IPADDR4::fdprint (
 int fd) const
```

Print an IPv4 address to the specified file descriptor.

#### Parameters

|           |                                         |
|-----------|-----------------------------------------|
| <i>fd</i> | File descriptor used to send IP address |
|-----------|-----------------------------------------|

### 16.97.3.2 IsAutoIP()

```
bool IPADDR4::IsAutoIP () [inline]
```

Check if the [IPADDR4](#) object contains an AutoIP address.

#### Return values

|             |                                              |
|-------------|----------------------------------------------|
| <i>true</i> | if the IP address value is an AutoIP address |
|-------------|----------------------------------------------|

See also

[IsLoopBack\(\)](#), [IsLinkLocal\(\)](#)

### 16.97.3.3 IsGlobalBroadcast()

```
bool IPADDR4::IsGlobalBroadcast () const [inline]
```

Check if the [IPADDR4](#) object contains a global broadcast address: 255.255.255.255.

Return values

|             |                                               |
|-------------|-----------------------------------------------|
| <i>true</i> | if the IP address value is a global broadcast |
|-------------|-----------------------------------------------|

See also

[IsLoopBack\(\)](#), [IsLinkLocal\(\)](#)

### 16.97.3.4 IsLoopBack()

```
bool IPADDR4::IsLoopBack () const [inline]
```

Check if the IP address is the loopback address for the interface.

Return values

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>true</i> | if the IP address value is the loopback address |
|-------------|-------------------------------------------------|

See also

[IsMultiCast\(\)](#), [IsLinkLocal\(\)](#)

### 16.97.3.5 IsmDns()

```
bool IPADDR4::IsmDns () [inline]
```

Check if the [IPADDR4](#) object contains a mDNS IP address the interface.

Return values

|             |                                           |
|-------------|-------------------------------------------|
| <i>true</i> | if the IP address value is a mDNS address |
|-------------|-------------------------------------------|

See also

[IsLoopBack\(\)](#), [IsLinkLocal\(\)](#)

### 16.97.3.6 IsMultiCast()

```
bool IPADDR4::IsMultiCast () const [inline]
```

Check if the [IPADDR4](#) object contains a Multicast IP address the interface.

Return values

|             |                                                |
|-------------|------------------------------------------------|
| <i>true</i> | if the IP address value is a Multicast address |
|-------------|------------------------------------------------|

See also

[IsLoopBack\(\)](#), [IsLinkLocal\(\)](#)

### 16.97.3.7 IsNull()

```
bool IPADDR4::IsNull () const [inline]
```

Check if the IP address is null.

## Return values

|             |                                 |
|-------------|---------------------------------|
| <i>true</i> | if the IP address value is null |
|-------------|---------------------------------|

## See also

[NotNull\(\)](#), [SetNull\(\)](#)**16.97.3.8 NotNull()**

```
bool IPADDR4::NotNull () const [inline]
```

Check if the IP address is not null.

## Return values

|             |                                     |
|-------------|-------------------------------------|
| <i>true</i> | if the IP address value is not null |
|-------------|-------------------------------------|

## See also

[IsNull\(\)](#), [SetNull\(\)](#)**16.97.3.9 SetFromAscii()**

```
void IPADDR4::SetFromAscii (
 const char * cp)
```

Set the IPv4 address from a character string.

## Parameters

|           |                                               |
|-----------|-----------------------------------------------|
| <i>cp</i> | Character string. For example, "192.168.1.10" |
|-----------|-----------------------------------------------|

**16.97.3.10 SetNull()**

```
void IPADDR4::SetNull () [inline]
```

Set the IP address to null.

## See also

[IsNull\(\)](#), [NotNull\(\)](#)**16.97.3.11 sprintf()**

```
int IPADDR4::sprintf (
 char * cp,
 int maxlen) const
```

sprintf an IPv4 address to the specified buffer

## Parameters

|             |                              |
|-------------|------------------------------|
| <i>cp</i>   | Destination character buffer |
| <i>maxl</i> | Maximum number of characters |

## Returns

Number of characters

The documentation for this class was generated from the following file:

- `nettypes.h`

## 16.98 IPADDR6 Class Reference

Used to hold and manipulate IPv4 and IPv6 addresses in dual stack mode.

```
#include <ipv6_addr.h>
```

### Public Member Functions

- bool [IsEmbeddedIPv4](#) () const  
*An [IPADDR6](#) object can store a IPv4 or IPv6 address. This function returns true if the instance contains an IPv4 address.*

- void [SetFromUInt32Shortcut](#) (uint32\_t w0, uint32\_t w1, uint32\_t w2, uint32\_t w3)  
*Set the IP address value of an [IPADDR6](#) object from 4 discrete uint32\_t values.*
- void [SetNull](#) ()  
*Set the IP address value of an [IPADDR6](#) object to null.*

### Static Public Member Functions

- static [IPADDR6 AsciiToIp6](#) (const char \*cp, bool bembed\_v4addresses=true)  
*Static function to return an [IPADDR6](#) object created from an ASCII value IPv4 or IPv6 address.*
- static [IPADDR6 NullIP](#) ()  
*Static function to return a null [IPADDR6](#) object.*

### 16.98.1 Detailed Description

Used to hold and manipulate IPv4 and IPv6 addresses in dual stack mode.

#### Note

It is recommended to use the [IPADDR](#) object, which can hold either an IPv4 or IPv6 address, rather than explicitly specifying IPv6.

## 16.98.2 Member Function Documentation

### 16.98.2.1 AsciiToIp6()

```
static IPADDR6 IPADDR6::AsciiToIp6 (
 const char * cp,
 bool bembed_v4addresses = true) [static]
```

Static function to return an [IPADDR6](#) object created from an ASCII value IPv4 or IPv6 address.

#### Parameters

|                           |                                                                  |
|---------------------------|------------------------------------------------------------------|
| <i>*cp</i>                | Pointer to the ASCII string representing an IPv4 or IPv6 address |
| <i>bembed_v4addresses</i> | If false function will only process an IPv6 address              |

#### Return values

|                         |        |
|-------------------------|--------|
| <a href="#">IPADDR6</a> | object |
|-------------------------|--------|

#### See also

[NullIP\(\)](#)

### 16.98.2.2 Extract4()

```
IPADDR4 IPADDR6::Extract4 () const [inline]
```

Extracts an IPv4 address from the object.

This function extracts an IPv4 address from an [IPADDR6](#) object that contains an embedded IPv4 address. If the object contains an IPv6 address instead of an embedded IPv4, it returns a null IPv4 address (0.0.0.0).

#### Returns

[IPADDR4](#) object containing the extracted IPv4 address, or null (0.0.0.0) if the [IPADDR6](#) object does not contain an embedded IPv4 address

#### See also

[IsEmbeddedIPV4\(\)](#), [GetEmbeddedIP4UInt\(\)](#)

### 16.98.2.3 fdprint()

```
void IPADDR6::fdprint (
 int fd,
 bool bCompact = true,
 bool bShowV4Raw = false) const
```

Print the IP address to the specified file descriptor.

#### Parameters

|                   |                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>fd</i>         | Valid file descriptor to send the data                                                                                                        |
| <i>bCompact</i>   | Display IPv6 address in compact notation                                                                                                      |
| <i>bShowV4Raw</i> | Normally set to false. If set to true, will display the IPv4 address 128-bits of the IP address object in the raw format "::FFFF:xx.xx.xx.xx" |

#### See also

[print\(\)](#), [sprintf\(\)](#)

#### 16.98.2.4 GetEmbeddedIP4Uint()

```
uint32_t IPADDR6::GetEmbeddedIP4Uint () const [inline]
```

Get the embedded IPv4 address as a 32-bit unsigned integer.

This function returns the embedded IPv4 address as a raw 32-bit unsigned integer value. This is useful when you need the IPv4 address in its numeric form for calculations or comparisons.

##### Returns

32-bit unsigned integer representation of the IPv4 address, or 0 if the [IPADDR6](#) object does not contain an embedded IPv4 address

##### Note

The returned value is in natural order as the `beuint32_t` cast converts.

##### See also

[Extract4\(\)](#), [IsEmbeddedIPV4\(\)](#)

#### 16.98.2.5 IsEmbeddedIPV4()

```
bool IPADDR6::IsEmbeddedIPV4 () const [inline]
```

An [IPADDR6](#) object can store a IPv4 or IPv6 address. This function returns true if the instance contains an IPv4 address.

Internally, an IPv4 address is stored in the format: "::FFFF:xx.xx.xx.xx"

##### Return values

|              |                                                                 |
|--------------|-----------------------------------------------------------------|
| <i>true</i>  | If the <a href="#">IPADDR6</a> object contains and IPv4 address |
| <i>false</i> | Otherwise                                                       |

#### 16.98.2.6 IsLinkLocal()

```
bool IPADDR6::IsLinkLocal () const [inline]
```

Check if the IP address is the link-local address for the interface.

Link local is

`FE80::/10`

. Masks the top 10 bits and check.

##### Return values

|             |                                                   |
|-------------|---------------------------------------------------|
| <i>true</i> | if the IP address value is the link-local address |
|-------------|---------------------------------------------------|

##### See also

[IsLoopBack\(\)](#), [IsMultiCast\(\)](#)

#### 16.98.2.7 IsLoopBack()

```
bool IPADDR6::IsLoopBack () const [inline]
```

Check if the IP address is the loopback address for the interface.

##### Return values

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>true</i> | if the IP address value is the loopback address |
|-------------|-------------------------------------------------|

##### See also

[IsMultiCast\(\)](#), [IsLinkLocal\(\)](#)

**16.98.2.8 IsMultiCast()**

```
bool IPADDR6::IsMultiCast () const [inline]
```

Check if the [IPADDR6](#) object contains a Multicast IP address the interface.

Return values

|             |                                                |
|-------------|------------------------------------------------|
| <i>true</i> | if the IP address value is a Multicast address |
|-------------|------------------------------------------------|

See also

[IsLoopBack\(\)](#), [IsLinkLocal\(\)](#)

**16.98.2.9 IsNull()**

```
bool IPADDR6::IsNull () const [inline]
```

Check if the IP address is null.

Return values

|             |                                 |
|-------------|---------------------------------|
| <i>true</i> | if the IP address value is null |
|-------------|---------------------------------|

See also

[NotNull\(\)](#)

**16.98.2.10 McastMac()**

```
MACADDR IPADDR6::McastMac () const
```

Return the MAC address used for Multicasts for the interface.

Return values

|                         |                               |
|-------------------------|-------------------------------|
| <a href="#">MACADDR</a> | if a Multicast address exists |
| <i>null</i>             | otherwise                     |

**16.98.2.11 NotNull()**

```
bool IPADDR6::NotNull () const [inline]
```

Check if the IP address is not null.

Return values

|             |                                     |
|-------------|-------------------------------------|
| <i>true</i> | if the IP address value is not null |
|-------------|-------------------------------------|

See also

[IsNull\(\)](#)

**16.98.2.12 NullIP()**

```
static IPADDR6 IPADDR6::NullIP () [static]
```

Static function to return a null [IPADDR6](#) object.

Static functions can be called without a specific C++ object. For example,

```
if (myIPAddress == IPADDR6::NullIP())
 iprintf("myIPAddress is null\r\n");
else
 iprintf("myIPAddress = %I\r\n", myIPAddress);
```

[IPADDR6::NullIP\(\)](#) can be used on [IPADDR](#), [IPADDR4](#) and [IPADDR6](#) objects.

## Return values

|             |                                |
|-------------|--------------------------------|
| <i>null</i> | <a href="#">IPADDR6</a> object |
|-------------|--------------------------------|

## See also

[AsciiToIp6\(\)](#)**16.98.2.13 print()**

```
void IPADDR6::print (
 bool bCompact = true,
 bool bShowV4Raw = false) const
```

Print the IP address value to stdout.

## Parameters

|                   |                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>bCompact</i>   | Display IPv6 address in compact notation                                                                                                      |
| <i>bShowV4Raw</i> | Normally set to false. if set to true, will display the IPv4 address 128-bits of the IP address object in the raw format "::FFFF:xx.xx.xx.xx" |

## See also

[fdprint\(\)](#), [sprintf\(\)](#)**16.98.2.14 SetFromAscii()**

```
void IPADDR6::SetFromAscii (
 const char * cp,
 bool bembed_v4addresses = true)
```

Set the IP address value of an [IPADDR6](#) object.

## Parameters

|                           |                                                                  |
|---------------------------|------------------------------------------------------------------|
| <i>*cp</i>                | Pointer to the ASCII string representing an IPv4 or IPv6 address |
| <i>bembed_v4addresses</i> | If false function will only process an IPv6 address              |

## See also

[SetFromIP4\(\)](#), [SetNull\(\)](#)**16.98.2.15 SetFromIP4()**

```
void IPADDR6::SetFromIP4 (
 IPADDR4 ip)
```

Set the IP address value of an [IPADDR6](#) object from an [IPADDR4](#) object.

## Parameters

|           |                                |
|-----------|--------------------------------|
| <i>ip</i> | <a href="#">IPADDR4</a> object |
|-----------|--------------------------------|

## See also

[SetFromAscii\(\)](#), [SetNull\(\)](#)

**16.98.2.16 SetFromUint32Shortcut()**

```
void IPADDR6::SetFromUint32Shortcut (
 uint32_t w0,
 uint32_t w1,
 uint32_t w2,
 uint32_t w3) [inline]
```

Set the IP address value of an [IPADDR6](#) object from 4 discrete uint32\_t values.

**Parameters**

|           |                         |
|-----------|-------------------------|
| <i>w0</i> | Unsigned 32-bit integer |
| <i>w1</i> | Unsigned 32-bit integer |
| <i>w2</i> | Unsigned 32-bit integer |
| <i>w3</i> | Unsigned 32-bit integer |

**See also**

[SetFromAscii\(\)](#), [SetFromIP4\(\)](#), [SetNull\(\)](#)

**16.98.2.17 SetNull()**

```
void IPADDR6::SetNull () [inline]
```

Set the IP address value of an [IPADDR6](#) object to null.

**See also**

[SetFromAscii\(\)](#), [SetFromIP4\(\)](#)

**16.98.2.18 sprintf()**

```
int IPADDR6::sprintf (
 char * cp,
 int maxl,
 bool bCompact = true,
 bool bShowV4Raw = false) const
```

Print the IP address to the specified buffer.

**Parameters**

|                   |                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>*cp</i>        | Pointer to the destination buffer to store the data                                                                                           |
| <i>maxl</i>       | Maximum number of bytes to write to buffer                                                                                                    |
| <i>bCompact</i>   | Display IPv6 address in compact notation                                                                                                      |
| <i>bShowV4Raw</i> | Normally set to false. if set to true, will display the IPv4 address 128-bits of the IP address object in the raw format "::FFFF:xx.xx.xx.xx" |

**Returns**

Number of bytes copied to buffer

**See also**

[print\(\)](#), [fdprint\(\)](#)

## 16.99 IPPKT Struct Reference

Internal IPv4 Header Representation.

```
#include <ip.h>
```

### Public Attributes

- `uint8_t bVerHdrLen`  
*Version and header length (same as versionNLength in IpHeaderIPv4)*
- `uint8_t bTos`  
*Type of Service / Differentiated Services field (same as diffServNEcn)*
- `beuint16_t wLength`  
*Total packet length in bytes including header.*
- `beuint16_t wpktId`  
*Packet identification for fragment reassembly.*
- `beuint16_t wFlags_Frag`  
*Flags and fragment offset combined.*
- `uint8_t bTTL`  
*Time To Live / hop count.*
- `uint8_t proto`  
*Protocol number (TCP, UDP, ICMP, etc.)*
- `uint16_t hCSum`  
*Header checksum.*
- `IPADDR4 ipSrc`  
*Source IP address.*
- `IPADDR4 ipDst`  
*Destination IP address.*
- `uint8_t DATA []`  
*Flexible array member - payload data follows header (actual length varies by packet)*

### 16.99.1 Detailed Description

Internal IPv4 Header Representation.

This is the internal structure used throughout the NetBurner IP stack for manipulating IPv4 packets. It provides a slightly different layout than the standard `IpHeaderIPv4` structure for implementation convenience.

The `DATA[]` flexible array member allows direct access to the packet payload that follows the IP header.

#### Note

This structure is packed to ensure proper alignment with network packet data.

The `DATA[]` field extends beyond the structure to the actual packet length.

### 16.99.2 Member Data Documentation

#### 16.99.2.1 hCSum

```
uint16_t IPPKT::hCSum
```

Header checksum.

#### Warning

Do not make a big endian variable - checksumming is treated as native endian

The documentation for this struct was generated from the following file:

- `ip.h`

## 16.100 IPV6\_DEST Struct Reference

IPv6 destination cache element.

#include <ipv6\_interface.h>

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- [IPV6\\_DEST](#) \* [GetNext](#) ()  
*Get next destination in list.*
- void [free\\_element](#) ()  
*Free resources for this destination.*
- virtual bool [AgeStillValidTest](#) ()  
*Check if destination is still valid.*
- virtual void [ShowItem](#) ()  
*Display destination information.*

### Public Member Functions inherited from [IPV6\\_ROOT\\_EL](#)

- virtual ~[IPV6\\_ROOT\\_EL](#) ()  
*Virtual destructor.*

### Public Attributes

- [IPV6\\_NEIGHBOR](#) \* [m\\_pNeighbor](#)  
*Associated neighbor entry.*
- uint16\_t [m\\_PathMTU](#)  
*Path MTU to this destination.*
- uint32\_t [m\\_nSecsLastUsed](#)  
*Last time this destination was used.*
- int [m\\_nLockCount](#)  
*Reference count to prevent destruction.*
- bool [m\\_bStaticRoute](#)  
*True if this is a static route.*

### Public Attributes inherited from [IPV6\\_ROOT\\_EL](#)

- [IPV6\\_ROOT\\_EL](#) \* [m\\_pNext](#)  
*Next element in list.*
- [IPV6\\_ROOT\\_EL](#) \* [m\\_pPrev](#)  
*Previous element in list.*
- [IPV6\\_ROOT\\_EL\\_CONTAINER](#) \* [m\\_pContainer](#)  
*Container that owns this element.*
- [IPADDR6](#) [m\\_IPAddress](#)  
*IPv6 address associated with this element.*

#### 16.100.1 Detailed Description

IPv6 destination cache element.

Caches information about IPv6 destinations including path MTU and associated neighbor.

## 16.100.2 Member Function Documentation

### 16.100.2.1 AgeStillValidTest()

```
virtual bool IPV6_DEST::AgeStillValidTest () [virtual]
```

Check if destination is still valid.

Returns

true if destination is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

### 16.100.2.2 GetNext()

```
IPV6_DEST * IPV6_DEST::GetNext () [inline]
```

Get next destination in list.

Returns

Pointer to next destination or NULL

The documentation for this struct was generated from the following file:

- [ipv6\\_interface.h](#)

## 16.101 IPV6\_DHCPD Struct Reference

DHCPv6 server information element.

```
#include <ipv6_interface.h>
```

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- void **free\_element** ()  
*Free resources for this [DHCP](#) server element.*
- virtual bool **AgeStillValidTest** ()  
*Check if [DHCP](#) lease is still valid.*
- virtual void **ShowItem** ()  
*Display [DHCP](#) server information.*
- [IPV6\\_PREFIX](#) \* **FindIA\_Addr** ([IPV6\\_PREFIX](#) \*start)  
*Find associated IA address starting from given prefix.*
- uint32\_t **GetDhcpRenewTime** ()  
*Get [DHCP](#) renew time.*
- uint32\_t **GetDhcpRebindTime** ()  
*Get [DHCP](#) rebind time.*

### Public Member Functions inherited from [IPV6\\_ROOT\\_EL](#)

- virtual **~IPV6\_ROOT\_EL** ()  
*Virtual destructor.*

### Public Attributes

- uint8\_t **m\_ServerID** [CLIENT\_LONG\_SERVID]  
*Space to contain the ServerID of the leasing server.*
- uint32\_t **m\_IAID**  
*Identity Association Identifier.*
- uint32\_t **m\_renewTick**  
*Tick when lease should be renewed.*
- uint32\_t **m\_rebindTick**  
*Tick when lease should be rebound.*

## Public Attributes inherited from [IPV6\\_ROOT\\_EL](#)

- [IPV6\\_ROOT\\_EL](#) \* **m\_pNext**  
*Next element in list.*
- [IPV6\\_ROOT\\_EL](#) \* **m\_pPrev**  
*Previous element in list.*
- [IPV6\\_ROOT\\_EL\\_CONTAINER](#) \* **m\_pContainer**  
*Container that owns this element.*
- [IPADDR6](#) **m\_IPAddress**  
*IPv6 address associated with this element.*

### 16.101.1 Detailed Description

DHCPv6 server information element.

Stores information about DHCPv6 servers including lease timing and server identification.

### 16.101.2 Member Function Documentation

#### 16.101.2.1 AgeStillValidTest()

```
virtual bool IPV6_DHCPD::AgeStillValidTest () [virtual]
```

Check if [DHCP](#) lease is still valid.

Returns

true if lease is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

#### 16.101.2.2 FindIA\_Addr()

```
IPV6_PREFIX * IPV6_DHCPD::FindIA_Addr (
 IPV6_PREFIX * start)
```

Find associated IA address starting from given prefix.

Parameters

|              |                            |
|--------------|----------------------------|
| <i>start</i> | Starting prefix for search |
|--------------|----------------------------|

Returns

Pointer to found prefix or NULL

#### 16.101.2.3 GetDhcpRebindTime()

```
uint32_t IPV6_DHCPD::GetDhcpRebindTime () [inline]
```

Get [DHCP](#) rebind time.

Returns

Rebind time in ticks

#### 16.101.2.4 GetDhcpRenewTime()

```
uint32_t IPV6_DHCPD::GetDhcpRenewTime () [inline]
```

Get [DHCP](#) renew time.

Returns

Renew time in ticks

The documentation for this struct was generated from the following file:

## 16.102 IPV6\_DNS Struct Reference

IPv6 DNS server information element.

#include <ipv6\_interface.h>

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- [IPV6\\_DNS](#) \* **GetNext** ()  
*Get next DNS server in list.*
- virtual bool **AgeStillValidTest** ()  
*Check if DNS server is still valid.*
- virtual void **ShowItem** ()  
*Display DNS server information.*
- void **CleanUpAndRemove** ()  
*Clean up and remove DNS server from lists.*
- void **free\_element** ()  
*Free resources for this DNS server.*

### Public Member Functions inherited from [IPV6\\_ROOT\\_EL](#)

- virtual ~**IPV6\_ROOT\_EL** ()  
*Virtual destructor.*

### Public Attributes

- uint32\_t **m\_nSecsToBeValid**  
*Seconds until this DNS entry expires.*
- [IPV6\\_ROUTER](#) \* **pRouter**  
*Router that provided this DNS server.*
- [IPV6\\_DHCPD](#) \* **pDHCPD**  
*DHCP server that provided this DNS server.*

### Public Attributes inherited from [IPV6\\_ROOT\\_EL](#)

- [IPV6\\_ROOT\\_EL](#) \* **m\_pNext**  
*Next element in list.*
- [IPV6\\_ROOT\\_EL](#) \* **m\_pPrev**  
*Previous element in list.*
- [IPV6\\_ROOT\\_EL\\_CONTAINER](#) \* **m\_pContainer**  
*Container that owns this element.*
- [IPADDR6](#) **m\_IPAddress**  
*IPv6 address associated with this element.*

#### 16.102.1 Detailed Description

IPv6 DNS server information element.

Stores information about configured DNS servers including validity timing.

## 16.102.2 Member Function Documentation

### 16.102.2.1 AgeStillValidTest()

```
virtual bool IPV6_DNS::AgeStillValidTest () [virtual]
```

Check if DNS server is still valid.

#### Returns

true if DNS server is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

### 16.102.2.2 GetNext()

```
IPV6_DNS * IPV6_DNS::GetNext () [inline]
```

Get next DNS server in list.

#### Returns

Pointer to next DNS server

The documentation for this struct was generated from the following file:

- [ipv6\\_interface.h](#)

## 16.103 IPV6\_IA\_ADDR Struct Reference

DHCPv6 Identity Association address element.

```
#include <ipv6_interface.h>
```

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- void **free\_element** ()  
*Free resources for this IA address.*
- virtual bool [AgeStillValidTest](#) ()  
*Check if IA address is still valid.*
- virtual void **ShowItem** ()  
*Display IA address information.*

### Public Member Functions inherited from [IPV6\\_ROOT\\_EL](#)

- virtual  $\sim$ [IPV6\\_ROOT\\_EL](#) ()  
*Virtual destructor.*

### Additional Inherited Members

### Public Attributes inherited from [IPV6\\_ROOT\\_EL](#)

- [IPV6\\_ROOT\\_EL](#) \* **m\_pNext**  
*Next element in list.*
- [IPV6\\_ROOT\\_EL](#) \* **m\_pPrev**  
*Previous element in list.*

*Container that owns this element.*
- [IPADDR6](#) **m\_IPAddress**  
*IPv6 address associated with this element.*

### 16.103.1 Detailed Description

DHCPv6 Identity Association address element.

### 16.103.2 Member Function Documentation

#### 16.103.2.1 AgeStillValidTest()

```
virtual bool IPV6_IA_ADDR::AgeStillValidTest () [virtual]
```

Check if IA address is still valid.

Returns

true if address is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

The documentation for this struct was generated from the following file:

- [ipv6\\_interface.h](#)

## 16.104 IPV6\_NEIGHBOR Struct Reference

IPv6 neighbor cache element.

```
#include <ipv6_interface.h>
```

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- **IPV6\_NEIGHBOR** ()  
*Default constructor.*
- [IPV6\\_NEIGHBOR](#) \* **GetNext** ()  
*Get next neighbor in list.*
- void **free\_element** ()  
*Free resources for this neighbor.*
- void **Discard** ()  
*Discard pending packets and clean up.*
- bool **ProcessAdvert** ([IPV6FrameProcessingStruct](#) &p6proc, ICMP6\_ND\_ADVERT \*pRsp)  
*Process neighbor advertisement message.*
- void **ProcessTick** ()  
*Process timer tick for neighbor discovery.*
- void **Send\_ND\_Solicit** (bool multicast)  
*Send neighbor solicitation message.*
- **eRouteOutResult** **Send** ([IPV6FrameProcessingStruct](#) &p6proc, uint16\_t mtu)  
*Attempt to send packet via this neighbor.*
- virtual bool **AgeStillValidTest** ()  
*Check if neighbor is still valid.*

*Container that owns this element.*
- `IPADDR6 m_IPAddress`  
*IPv6 address associated with this element.*

### 16.104.1 Detailed Description

IPv6 neighbor cache element.

Manages neighbor discovery state and MAC address resolution for IPv6 addresses.

### 16.104.2 Member Function Documentation

#### 16.104.2.1 AgeStillValidTest()

```
virtual bool IPV6_NEIGHBOR::AgeStillValidTest () [virtual]
```

Check if neighbor is still valid.

Returns

true if neighbor is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

#### 16.104.2.2 CoreSendPend()

```
void IPV6_NEIGHBOR::CoreSendPend (
 PoolPtr pp)
```

Queue packet for transmission when neighbor becomes reachable.

## Parameters

|           |                 |
|-----------|-----------------|
| <i>pp</i> | Packet to queue |
|-----------|-----------------|

**16.104.2.3 GetNext()**

```
IPV6_NEIGHBOR * IPV6_NEIGHBOR::GetNext () [inline]
```

Get next neighbor in list.

## Returns

Pointer to next neighbor or NULL

**16.104.2.4 GetState()**

```
eMY_NEIGHBOR_STATE IPV6_NEIGHBOR::GetState () [inline]
```

Get current neighbor state.

## Returns

Current neighbor state

**16.104.2.5 ProcessAdvert()**

```
bool IPV6_NEIGHBOR::ProcessAdvert (
 IPv6FrameProcessingStruct & p6proc,
 ICMP6_ND_ADVERT * pRsp)
```

Process neighbor advertisement message.

## Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>p6proc</i> | IPv6 frame processing structure   |
| <i>pRsp</i>   | Pointer to neighbor advertisement |

## Returns

true if advertisement was processed successfully

**16.104.2.6 Send()**

```
eRouteOutResult IPV6_NEIGHBOR::Send (
 IPv6FrameProcessingStruct & p6proc,
 uint16_t mtu)
```

Attempt to send packet via this neighbor.

## Parameters

|               |                                 |
|---------------|---------------------------------|
| <i>p6proc</i> | IPv6 frame processing structure |
| <i>mtu</i>    | Maximum transmission unit       |

## Returns

Route result status

**16.104.2.7 Send\_ND\_Solicit()**

```
void IPV6_NEIGHBOR::Send_ND_Solicit (
 bool multicast)
```

Send neighbor solicitation message.

## Parameters

|                  |                                                        |
|------------------|--------------------------------------------------------|
| <i>multicast</i> | true to send multicast solicitation, false for unicast |
|------------------|--------------------------------------------------------|

**16.104.2.8 SendPending()**

`bool IPV6_NEIGHBOR::SendPending ()`  
 Send any pending packets.

## Returns

true if packets were sent

**16.104.2.9 SetState()**

`void IPV6_NEIGHBOR::SetState (`  
     `eMY_NEIGHBOR_STATE s)`  
 Set neighbor discovery state.

## Parameters

|          |                    |
|----------|--------------------|
| <i>s</i> | New neighbor state |
|----------|--------------------|

**16.104.2.10 StillValidToSend()**

`bool IPV6_NEIGHBOR::StillValidToSend ()`  
 Check if neighbor is still valid for sending.

## Returns

true if neighbor can be used for sending

The documentation for this struct was generated from the following file:

- `ipv6_interface.h`

**16.105 IPV6\_PREFIX Struct Reference**

IPv6 prefix and address management element.

`#include <ipv6_interface.h>`

### 16.105.1 Detailed Description

IPv6 prefix and address management element.

Manages IPv6 prefixes and addresses including their validity, timing, and source information.

### 16.105.2 Member Function Documentation

#### 16.105.2.1 AgeStillPreferred()

```
bool IPV6_PREFIX::AgeStillPreferred ()
```

Check if prefix is still preferred based on aging.

Returns

true if prefix is still preferred

#### 16.105.2.2 AgeStillValidTest()

```
virtual bool IPV6_PREFIX::AgeStillValidTest () [virtual]
```

Check if prefix is still valid based on aging.

Returns

true if prefix is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

#### 16.105.2.3 GetNext()

```
IPV6_PREFIX * IPV6_PREFIX::GetNext () [inline]
```

Get next prefix in list.

Returns

Pointer to next prefix

#### 16.105.2.4 GetRemainingDhcpLeasePreferredTime()

```
uint32_t IPV6_PREFIX::GetRemainingDhcpLeasePreferredTime () [inline]
```

Get remaining [DHCP](#) preferred time.

Returns

Remaining preferred time in seconds

#### 16.105.2.5 GetRemainingDhcpLeaseTime()

```
uint32_t IPV6_PREFIX::GetRemainingDhcpLeaseTime () [inline]
```

Get remaining [DHCP](#) lease time.

Returns

Remaining lease time in seconds

**16.105.2.6 GetState()**

```
eMY_ADDR_STATE IPV6_PREFIX::GetState () [inline]
```

Get current state of this address.

**Returns**

Current address state

**16.105.2.7 OnLink()**

```
bool IPV6_PREFIX::OnLink (
 const IPADDR6 & ip)
```

Check if given IP address is on-link for this prefix.

**Parameters**

|           |                       |
|-----------|-----------------------|
| <i>ip</i> | IPv6 address to check |
|-----------|-----------------------|

**Returns**

true if address is on-link

**16.105.2.8 Preferred()**

```
bool IPV6_PREFIX::Preferred ()
```

Check if this prefix is preferred.

**Returns**

true if prefix is preferred

**16.105.2.9 RemainingValidTime()**

```
uint32_t IPV6_PREFIX::RemainingValidTime () [inline]
```

Get remaining valid time for this prefix.

**Returns**

Remaining valid time in seconds

**16.105.2.10 Source()**

```
ePrefixSource IPV6_PREFIX::Source () [inline]
```

Get the source of this prefix.

**Returns**

Prefix source type

The documentation for this struct was generated from the following file:

- `ipv6_interface.h`

**16.106 IPV6\_ROOT\_EL Struct Reference**

Base class for all IPv6 interface elements.

```
#include <ipv6_interface.h>
```

Inherited by [IPV6\\_DEST](#), [IPV6\\_DHCPD](#), [IPV6\\_DNS](#), [IPV6\\_IA\\_ADDR](#), [IPV6\\_NEIGHBOR](#), [IPV6\\_PREFIX](#), and [IPV6\\_ROUTER](#).

### Public Member Functions

- virtual void **ShowItem** ()  
*Display information about this element.*
- virtual bool **AgeStillValidTest** ()  
*Test if this element is still valid based on aging.*
- virtual void **free\_element** ()  
*Free resources associated with this element.*
- virtual **~IPV6\_ROOT\_EL** ()  
*Virtual destructor.*

### Public Attributes

- **IPV6\_ROOT\_EL** \* **m\_pNext**  
*Next element in list.*
- **IPV6\_ROOT\_EL** \* **m\_pPrev**  
*Previous element in list.*
- **IPV6\_ROOT\_EL\_CONTAINER** \* **m\_pContainer**  
*Container that owns this element.*
- **IPADDR6** **m\_IPAddress**  
*IPv6 address associated with this element.*

## 16.106.1 Detailed Description

Base class for all IPv6 interface elements.

Provides common functionality for all IPv6 interface management elements including linked list management and aging.

## 16.106.2 Member Function Documentation

### 16.106.2.1 AgeStillValidTest()

```
virtual bool IPV6_ROOT_EL::AgeStillValidTest () [virtual]
```

Test if this element is still valid based on aging.

#### Returns

true if element is still valid, false if expired

Reimplemented in [IPV6\\_DEST](#), [IPV6\\_DHCPD](#), [IPV6\\_DNS](#), [IPV6\\_IA\\_ADDR](#), [IPV6\\_NEIGHBOR](#), [IPV6\\_PREFIX](#), and [IPV6\\_ROUTER](#).

The documentation for this struct was generated from the following file:

- [ipv6\\_interface.h](#)

## 16.107 IPV6\_ROOT\_EL\_CONTAINER Struct Reference

Container for managing collections of IPv6 root elements.

```
#include <ipv6_interface.h>
```

### Public Member Functions

- void **Insert** ([IPV6\\_ROOT\\_EL](#) \*pEl)  
*Insert element at the head of the list.*
- void **InsertBack** ([IPV6\\_ROOT\\_EL](#) \*pEl)  
*Insert element at the tail of the list.*
- [IPV6\\_ROOT\\_EL](#) \* **Find** (const [IPADDR6](#) &ip, bool age)

- Find element by IPv6 address.*
- `IPV6_ROOT_EL * First ()`  
*Get first element in container.*
- `IPV6_ROOT_EL_CONTAINER ()`  
*Default constructor.*
- `void Attach (IPv6Interface &Interface, const char *name)`  
*Attach container to an interface.*
- `void MoveToTop (IPV6_ROOT_EL *pEl)`  
*Move element to top of list.*
- `void Remove (IPV6_ROOT_EL *pEl)`  
*Remove element from container.*
- `void Show ()`  
*Display all elements in container.*

### Public Attributes

- `const char * m_name`  
*Name of this container.*
- `IPV6_ROOT_EL * m_pHead`  
*Head of element list.*
- `IPV6_ROOT_EL * m_pTail`  
*Tail of element list.*
- `IPv6Interface * m_pInterface`  
*Interface that owns this container.*
- `int m_nElements`  
*Number of elements in container.*

## 16.107.1 Detailed Description

Container for managing collections of IPv6 root elements.

Provides organized storage and retrieval of IPv6 interface elements with automatic aging and management functionality.

## 16.107.2 Member Function Documentation

### 16.107.2.1 Attach()

```
void IPV6_ROOT_EL_CONTAINER::Attach (
 IPv6Interface & Interface,
 const char * name)
```

Attach container to an interface.

#### Parameters

|                  |                             |
|------------------|-----------------------------|
| <i>Interface</i> | IPv6 interface to attach to |
| <i>name</i>      | Name for this container     |

### 16.107.2.2 Find()

```
IPV6_ROOT_EL * IPV6_ROOT_EL_CONTAINER::Find (
 const IPADDR6 & ip,
 bool age)
```

Find element by IPv6 address.

## Parameters

|            |                                              |
|------------|----------------------------------------------|
| <i>ip</i>  | IPv6 address to search for                   |
| <i>age</i> | Whether to perform aging check during search |

## Returns

Pointer to found element or NULL if not found

**16.107.2.3 First()**

```
IPV6_ROOT_EL * IPV6_ROOT_EL_CONTAINER::First ()
```

Get first element in container.

## Returns

Pointer to first element or NULL if empty

**16.107.2.4 Insert()**

```
void IPV6_ROOT_EL_CONTAINER::Insert (
 IPV6_ROOT_EL * pEl)
```

Insert element at the head of the list.

## Parameters

|                                  |                   |
|----------------------------------|-------------------|
| $p \leftrightarrow$<br><i>El</i> | Element to insert |
|----------------------------------|-------------------|

**16.107.2.5 InsertBack()**

```
void IPV6_ROOT_EL_CONTAINER::InsertBack (
 IPV6_ROOT_EL * pEl)
```

Insert element at the tail of the list.

## Parameters

|                                  |                   |
|----------------------------------|-------------------|
| $p \leftrightarrow$<br><i>El</i> | Element to insert |
|----------------------------------|-------------------|

**16.107.2.6 MoveToTop()**

```
void IPV6_ROOT_EL_CONTAINER::MoveToTop (
 IPV6_ROOT_EL * pEl)
```

Move element to top of list.

## Parameters

|                                  |                 |
|----------------------------------|-----------------|
| $p \leftrightarrow$<br><i>El</i> | Element to move |
|----------------------------------|-----------------|

**16.107.2.7 Remove()**

```
void IPV6_ROOT_EL_CONTAINER::Remove (
 IPV6_ROOT_EL * pEl)
```

Remove element from container.

## Parameters

|                                  |                   |
|----------------------------------|-------------------|
| $p \leftrightarrow$<br><i>El</i> | Element to remove |
|----------------------------------|-------------------|

The documentation for this struct was generated from the following file:

- `ipv6_interface.h`

## 16.108 IPV6\_ROUTER Struct Reference

IPv6 router information element.

```
#include <ipv6_interface.h>
```

Inherits [IPV6\\_ROOT\\_EL](#).

### Public Member Functions

- [IPV6\\_ROUTER \\* GetNextValid](#) ()  
*Get next valid router in list.*
- [IPV6\\_ROUTER \\* GetNext](#) ()  
*Get next router in list.*
- void **CleanUpAndRemove** ()  
*Clean up and remove router from lists.*
- void **RemoveFromDefault** ()  
*Remove router from default router list.*
- void **free\_element** ()  
*Free resources for this router.*
- virtual bool [AgeStillValidTest](#) ()  
*Check if router is still valid.*
- virtual void **ShowItem** ()  
*Display router information.*

### Public Member Functions inherited from [IPV6\\_ROOT\\_EL](#)

- virtual  $\sim$ [IPV6\\_ROOT\\_EL](#) ()  
*Virtual destructor.*

### Public Attributes

- `uint16_t m_CheckSumCache`  
*Cached checksum value.*
- `uint32_t m_SecsLastAdvertise`  
*Seconds since last router advertisement.*
- [IPV6\\_NEIGHBOR](#) \* `m_pNeighbor`  
*Associated neighbor entry.*
- `uint32_t m_Life_In_Secs`  
*Router lifetime in seconds.*
- `uint16_t m_PathMTU`  
*Path MTU for this router.*

## Public Attributes inherited from [IPV6\\_ROOT\\_EL](#)

- [IPV6\\_ROOT\\_EL](#) \* **m\_pNext**  
*Next element in list.*
- [IPV6\\_ROOT\\_EL](#) \* **m\_pPrev**  
*Previous element in list.*

*Container that owns this element.*
- [IPADDR6](#) **m\_IPAddress**  
*IPv6 address associated with this element.*

### 16.108.1 Detailed Description

IPv6 router information element.

Stores information about IPv6 routers including advertisement timing and path MTU.

### 16.108.2 Member Function Documentation

#### 16.108.2.1 AgeStillValidTest()

```
virtual bool IPV6_ROUTER::AgeStillValidTest () [virtual]
```

Check if router is still valid.

##### Returns

true if router is still valid

Reimplemented from [IPV6\\_ROOT\\_EL](#).

#### 16.108.2.2 GetNext()

```
IPV6_ROUTER * IPV6_ROUTER::GetNext ()
```

Get next router in list.

##### Returns

Pointer to next router or NULL

#### 16.108.2.3 GetNextValid()

```
IPV6_ROUTER * IPV6_ROUTER::GetNextValid ()
```

Get next valid router in list.

##### Returns

Pointer to next valid router or NULL

The documentation for this struct was generated from the following file:

- [ipv6\\_interface.h](#)

## 16.109 IPv6FrameProcessingStruct Struct Reference

IPv6 frame processing structure for packet analysis and header walking.

```
#include <ipv6_interface.h>
```

## Public Member Functions

- void **free\_proc\_struct** ()  
*Free the processing structure and associated resources.*
- void **release** ()  
*Release buffer pool resources.*
- uint8\_t **WalkNextHeader** (int \*pError\_offset=NULL)  
*Walk through IPv6 extension headers to the next header.*
- bool **DestOptHasError** (puint8\_t pData, int \*pError\_offset)  
*Check destination options header for errors.*
- bool **HopByHopParseHasError** (puint8\_t pData, int \*pError\_offset)  
*Check hop-by-hop options header for errors.*
- bool **RouterHeaderParseHasError** (puint8\_t pData, int \*pError\_offset)  
*Check routing header for errors.*
- **IPv6FrameProcessingStruct** (PoolPtr pp)  
*Constructor with buffer pool.*
- **IPv6FrameProcessingStruct** ()  
*Default constructor.*
- puint8\_t **GetDataPointer** ()  
*Get pointer to frame data.*
- EFRAME \* **GetEframe** ()  
*Get pointer to Ethernet frame.*

## Public Attributes

- **PoolPtr** root\_pp  
*Root buffer pool pointer.*
- IP6FRAME \* **pIPf**  
*Pointer to IPv6 frame header.*
- uint8\_t \* **pData**  
*Pointer to current data location.*
- uint16\_t **nDataLen**  
*Length of current data segment.*
- uint8\_t \* **pLargeData**  
*Used for fragments larger than 1500 bytes.*

## 16.109.1 Detailed Description

IPv6 frame processing structure for packet analysis and header walking.

This structure contains all the necessary components for processing IPv6 packets, including buffer management and header parsing capabilities.

## 16.109.2 Constructor & Destructor Documentation

### 16.109.2.1 IPv6FrameProcessingStruct()

```
IPv6FrameProcessingStruct::IPv6FrameProcessingStruct (
 PoolPtr pp)
```

Constructor with buffer pool.

#### Parameters

|           |                     |
|-----------|---------------------|
| <i>pp</i> | Buffer pool pointer |
|-----------|---------------------|

### 16.109.3 Member Function Documentation

#### 16.109.3.1 DestOptHasError()

```
bool IPv6FrameProcessingStruct::DestOptHasError (
 uint8_t pData,
 int * pError_offset)
```

Check destination options header for errors.

##### Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <i>pData</i>         | Pointer to header data                          |
| <i>pError_offset</i> | Optional pointer to store error offset location |

##### Returns

true if errors found, false otherwise

#### 16.109.3.2 GetDataPointer()

```
uint8_t IPv6FrameProcessingStruct::GetDataPointer () [inline]
```

Get pointer to frame data.

##### Returns

Pointer to frame data or NULL if not available

#### 16.109.3.3 GetEframe()

```
EFRAME * IPv6FrameProcessingStruct::GetEframe () [inline]
```

Get pointer to Ethernet frame.

##### Returns

Pointer to EFRAME or NULL if not available

#### 16.109.3.4 HopByHopParseHasError()

```
bool IPv6FrameProcessingStruct::HopByHopParseHasError (
 uint8_t pData,
 int * pError_offset)
```

Check hop-by-hop options header for errors.

##### Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <i>pData</i>         | Pointer to header data                          |
| <i>pError_offset</i> | Optional pointer to store error offset location |

##### Returns

true if errors found, false otherwise

#### 16.109.3.5 RouterHeaderParseHasError()

```
bool IPv6FrameProcessingStruct::RouterHeaderParseHasError (
 uint8_t pData,
 int * pError_offset)
```

Check routing header for errors.

## Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <i>pData</i>         | Pointer to header data                          |
| <i>pError_offset</i> | Optional pointer to store error offset location |

## Returns

true if errors found, false otherwise

**16.109.3.6 WalkNextHeader()**

```
uint8_t IPv6FrameProcessingStruct::WalkNextHeader (
 int * pError_offset = NULL)
```

Walk through IPv6 extension headers to the next header.

## Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <i>pError_offset</i> | Optional pointer to store error offset location |
|----------------------|-------------------------------------------------|

## Returns

Next header type value

The documentation for this struct was generated from the following file:

- `ipv6_interface.h`

**16.110 IPv6Interface Class Reference**

Main IPv6 interface management class.

```
#include <ipv6_interface.h>
```

Inherits `TimeoutElement`.

**Public Member Functions**

- `uint16_t GetDestinationMTU` (const `IPADDR` &ip)  
*Get destination MTU for specified address.*

**16.110.1 Detailed Description**

Main IPv6 interface management class.

Provides comprehensive IPv6 interface functionality including address management, routing, neighbor discovery, and protocol processing.

**16.110.2 Constructor & Destructor Documentation****16.110.2.1 IPv6Interface()**

```
IPv6Interface::IPv6Interface (
 int ifnum)
```

Constructor for IPv6 interface.

**Parameters**

|              |                  |
|--------------|------------------|
| <i>ifnum</i> | Interface number |
|--------------|------------------|

**16.110.3 Member Function Documentation****16.110.3.1 AddDefaultGateway()**

```
IPV6_ROUTER * IPv6Interface::AddDefaultGateway (
 const IPADDR6 & ip)
```

Add default gateway to interface.

**Parameters**

|           |                                 |
|-----------|---------------------------------|
| <i>ip</i> | IPv6 address of default gateway |
|-----------|---------------------------------|

**Returns**

Pointer to created router entry or NULL on failure

**See also**

[RemoveDefaultGateway\(\)](#), [AddStaticAddress\(\)](#), [AddStaticDNS\(\)](#)

**16.110.3.2 AddStaticAddress()**

```
IPV6_PREFIX * IPv6Interface::AddStaticAddress (
 const IPADDR6 & ip,
 int PrefixLen)
```

Add static IPv6 address to interface.

**Parameters**

|                  |                       |
|------------------|-----------------------|
| <i>ip</i>        | IPv6 address to add   |
| <i>PrefixLen</i> | Prefix length in bits |

**Returns**

Pointer to created prefix entry or NULL on failure

**See also**

[RemoveStaticAddress\(\)](#), [AddDefaultGateway\(\)](#), [AddStaticDNS\(\)](#)

**16.110.3.3 AddStaticDNS()**

```
IPV6_DNS * IPv6Interface::AddStaticDNS (
 const IPADDR6 & ip)
```

Add static DNS server to interface.

**Parameters**

|           |                            |
|-----------|----------------------------|
| <i>ip</i> | IPv6 address of DNS server |
|-----------|----------------------------|

**Returns**

Pointer to created DNS entry or NULL on failure

**See also**

[RemoveStaticDNS\(\)](#), [AddStaticAddress\(\)](#), [AddDefaultGateway\(\)](#)

**16.110.3.4 GetDestinationMTU()**

```
uint16_t IPv6Interface::GetDestinationMTU (
 const IPADDR & ip)
```

Get destination MTU for specified address.

**Parameters**

|           |                        |
|-----------|------------------------|
| <i>ip</i> | Destination IP address |
|-----------|------------------------|

**Returns**

MTU value for the destination

**16.110.3.5 GetFirst\_IP6\_Interface()**

```
static IPv6Interface * IPv6Interface::GetFirst_IP6_Interface () [static]
```

Get first IPv6 interface in the system.

**Returns**

Pointer to first interface or NULL if none exist

**See also**

[GetInterfaceN\(\)](#), [GetNext\\_IP6\\_Interface\(\)](#)

**16.110.3.6 GetInterfaceForDestination()**

```
static IPv6Interface * IPv6Interface::GetInterfaceForDestination (
 const IPADDR6 & ip) [static]
```

Find interface that can reach the specified destination.

**Parameters**

|           |                          |
|-----------|--------------------------|
| <i>ip</i> | Destination IPv6 address |
|-----------|--------------------------|

**Returns**

Pointer to appropriate interface or NULL if none found

**See also**

[GetInterfaceForSource\(\)](#), [GetInterfaceN\(\)](#)

**16.110.3.7 GetInterfaceForSource()**

```
static IPv6Interface * IPv6Interface::GetInterfaceForSource (
 const IPADDR6 & ip) [static]
```

Find interface that should be used as source for specified destination.

**Parameters**

|           |                          |
|-----------|--------------------------|
| <i>ip</i> | Destination IPv6 address |
|-----------|--------------------------|

**Returns**

Pointer to appropriate interface or NULL if none found

**See also**

[GetInterfaceForDestination\(\)](#), [GetInterfaceN\(\)](#)

**16.110.3.8 GetInterfaceN()**

```
static IPv6Interface * IPv6Interface::GetInterfaceN (
 int n) [static]
```

Get IPv6 interface by interface number.

**Parameters**

|          |                  |
|----------|------------------|
| <i>n</i> | Interface number |
|----------|------------------|

**Returns**

Pointer to interface or NULL if not found

**See also**

[GetFirst\\_IP6\\_Interface\(\)](#), [GetNext\\_IP6\\_Interface\(\)](#)

**16.110.3.9 GetInterfaceNumber()**

```
int IPv6Interface::GetInterfaceNumber () [inline]
```

Get interface number.

**Returns**

Interface number for this interface

**16.110.3.10 GetMyFirstAddress()**

```
IPADDR6 IPv6Interface::GetMyFirstAddress () [inline]
```

Get first configured IPv6 address.

**Returns**

First IPv6 address or null address if none configured

**16.110.3.11 GetMyNextAddress()**

```
IPADDR6 IPv6Interface::GetMyNextAddress (
 const IPADDR6 & ip) [inline]
```

Get next IPv6 address after specified address.

**Parameters**

|           |                      |
|-----------|----------------------|
| <i>ip</i> | Current IPv6 address |
|-----------|----------------------|

**Returns**

Next IPv6 address or null address if at end

**16.110.3.12 GetNext\_IP6\_Interface()**

```
IPv6Interface * IPv6Interface::GetNext_IP6_Interface ()
```

Get next IPv6 interface in the list.

**Returns**

Pointer to next interface or NULL if at end of list

**See also**

[GetFirst\\_IP6\\_Interface\(\)](#), [GetInterfaceN\(\)](#)

**16.110.3.13 HadLink()**

```
bool IPv6Interface::HadLink () [inline]
```

Check if interface has had link connectivity.

**Returns**

true if interface has had link

**16.110.3.14 HasRoute()**

```
bool IPv6Interface::HasRoute (
 const IPADDR6 & ip6)
```

Check if there is a route to the specified IPv6 address.

**Parameters**

|            |                          |
|------------|--------------------------|
| <i>ip6</i> | Destination IPv6 address |
|------------|--------------------------|

**Returns**

true if route exists

**See also**

[IsMyAddress\(\)](#), [OnLink\(\)](#)

### 16.110.3.15 IsMyAddress()

```
bool IPv6Interface::IsMyAddress (
 const IPADDR6 & ip6,
 bool bMustBePreferred)
```

Check if IPv6 address belongs to this interface.

#### Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <i>ip6</i>              | IPv6 address to check                      |
| <i>bMustBePreferred</i> | true if address must be in preferred state |

#### Returns

true if address belongs to this interface

#### See also

[OnLink\(\)](#), [HasRoute\(\)](#)

### 16.110.3.16 MyDNSAddress()

```
IPADDR6 IPv6Interface::MyDNSAddress ()
```

Get DNS server address for this interface.

#### Returns

IPv6 address of DNS server

### 16.110.3.17 MySourceAddress()

```
IPADDR6 IPv6Interface::MySourceAddress (
 const IPADDR6 & ip)
```

Determine best source address for communicating with destination.

#### Parameters

|           |                          |
|-----------|--------------------------|
| <i>ip</i> | Destination IPv6 address |
|-----------|--------------------------|

#### Returns

Best source address for this interface

### 16.110.3.18 NotifyReachable()

```
void IPv6Interface::NotifyReachable (
 const IPADDR6 & ip6)
```

Notify that neighbor is reachable.

#### Parameters

|            |                                    |
|------------|------------------------------------|
| <i>ip6</i> | IPv6 address of reachable neighbor |
|------------|------------------------------------|

### 16.110.3.19 NotifyUnreachable()

```
void IPv6Interface::NotifyUnreachable (
 const IPADDR6 & ip)
```

Notify that neighbor is unreachable.

## Parameters

|           |                                      |
|-----------|--------------------------------------|
| <i>ip</i> | IPv6 address of unreachable neighbor |
|-----------|--------------------------------------|

**16.110.3.20 OnLink()**

```
bool IPv6Interface::OnLink (
 const IPADDR6 & ip6)
```

Check if IPv6 address is on-link for this interface.

## Parameters

|            |                       |
|------------|-----------------------|
| <i>ip6</i> | IPv6 address to check |
|------------|-----------------------|

## Returns

true if address is on-link

## See also

[IsMyAddress\(\)](#), [HasRoute\(\)](#)

**16.110.3.21 ping()**

```
int IPv6Interface::ping (
 const IPADDR6 & ip,
 uint16_t id,
 uint16_t seq,
 uint16_t wait,
 int siz)
```

Send IPv6 ping to specified address.

## Parameters

|             |                            |
|-------------|----------------------------|
| <i>ip</i>   | Destination IPv6 address   |
| <i>id</i>   | Ping identifier            |
| <i>seq</i>  | Ping sequence number       |
| <i>wait</i> | Maximum wait time in ticks |
| <i>siz</i>  | Ping packet size           |

## Returns

Ping result status

**16.110.3.22 RemoveDefaultGateway()**

```
bool IPv6Interface::RemoveDefaultGateway (
 const IPADDR6 & ip)
```

Remove default gateway from interface.

## Parameters

|           |                                   |
|-----------|-----------------------------------|
| <i>ip</i> | IPv6 address of gateway to remove |
|-----------|-----------------------------------|

**Returns**

true if gateway was found and removed

**See also**

[AddDefaultGateway\(\)](#), [RemoveStaticAddress\(\)](#), [RemoveStaticDNS\(\)](#)

**16.110.3.23 RemoveStaticAddress()**

```
bool IPv6Interface::RemoveStaticAddress (
 const IPADDR6 & ip)
```

Remove static IPv6 address from interface.

**Parameters**

|           |                        |
|-----------|------------------------|
| <i>ip</i> | IPv6 address to remove |
|-----------|------------------------|

**Returns**

true if address was found and removed

**See also**

[AddStaticAddress\(\)](#), [RemoveDefaultGateway\(\)](#), [RemoveStaticDNS\(\)](#)

**16.110.3.24 RemoveStaticDNS()**

```
bool IPv6Interface::RemoveStaticDNS (
 const IPADDR6 & ip)
```

Remove static DNS server from interface.

**Parameters**

|           |                                      |
|-----------|--------------------------------------|
| <i>ip</i> | IPv6 address of DNS server to remove |
|-----------|--------------------------------------|

**Returns**

true if DNS server was found and removed

**See also**

[AddStaticDNS\(\)](#), [RemoveStaticAddress\(\)](#), [RemoveDefaultGateway\(\)](#)

**16.110.3.25 SendMLDRegistration()**

```
int IPv6Interface::SendMLDRegistration (
 const IPADDR & regAddr,
 bool joinNotLeave = true)
```

Send MLD registration message.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <i>regAddr</i>      | Multicast address to register |
| <i>joinNotLeave</i> | true to join, false to leave  |

**Returns**

Result status

**16.110.3.26 SetStaticDNS()**

```
void IPv6Interface::SetStaticDNS (
 IPADDR6 dns) [inline]
```

Set static DNS server address.

**Parameters**

|            |                            |
|------------|----------------------------|
| <i>dns</i> | IPv6 address of DNS server |
|------------|----------------------------|

**16.110.3.27 ShowAllInfo()**

```
static void IPv6Interface::ShowAllInfo () [static]
```

Display IPv6 information for all interfaces.

**See also**

[ShowInfo\(\)](#)

**16.110.3.28 ShowInfo()**

```
void IPv6Interface::ShowInfo ()
```

Display IPv6 information for this interface.

**See also**

[ShowAllInfo\(\)](#)

**16.110.4 Friends And Related Symbol Documentation****16.110.4.1 InitIPv6**

```
void InitIPv6 (
 int ifnum = 0) [friend]
```

**16.110.4.2 Ping6**

```
int Ping6 (
 const IPADDR6 & to,
 uint16_t id,
 uint16_t seq,
 uint16_t maxwaitticks,
 int size = 32) [friend]
```

Send an IPv6 "ping" packet and wait the specified timeout for a response.

Sends an ICMPv6 echo request packet to the specified IPv6 destination address and waits for an echo reply. The ping uses the primary network interface. This follows the ICMPv6 echo request/reply protocol defined in RFC 4443.

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <i>to</i>           | Destination IPv6 address to ping                           |
| <i>id</i>           | ICMP identifier field (typically process ID)               |
| <i>seq</i>          | ICMP sequence number field (typically increments per ping) |
| <i>maxwaitticks</i> | Maximum wait time in system time ticks                     |
| <i>size</i>         | Size of ping data payload in bytes (default: 32)           |

**Returns**

>=0 Number of ticks elapsed waiting for the response (successful ping) -1 Timeout occurred - no response received within maxwaitticks -2 Error other than timeout occurred

**Note**

IPv6 ping packets may traverse different paths than IPv4 pings to the same host.  
Link-local addresses require the appropriate zone ID/interface specification.

## 16.111 JsonAllocString Struct Reference

A list of large strings that are created with malloc.

```
#include <json_lexer.h>
```

**Public Attributes**

- [JsonAllocString](#) \* **pNext**  
*A pointer to the next string.*
- char **data** []  
*The current string data.*

### 16.111.1 Detailed Description

A list of large strings that are created with malloc.

The documentation for this struct was generated from the following file:

- [json\\_lexer.h](#)

## 16.112 JsonLexerFDAdapter Class Reference

Get the type name of the JSON primitive type passed in.

```
#include <json_lexer.h>
```

Inherits [ParsedJsonDataSet](#), and [fd\\_adapter](#).

**Additional Inherited Members****Public Member Functions inherited from [ParsedJsonDataSet](#)**

- void **EnableLargeStrings** (bool b)  
*Call to allow allocation of strings larger than 1500 bytes.*
- virtual int [WriteData](#) (const unsigned char \*pCopyFrom, int numBytes)  
*Writes the passed in data to the JSON data set.*
- virtual int [ReadFrom](#) (int fd)  
*Reads in data from the specified file descriptor and parses it into the JSON data set.*
- bool [CopyObject](#) ([ParsedJsonDataSet](#) &src\_set)  
*Copies the provided JSON data set into the current one.*
- void **ClearObject** ()  
*Clears all data from the object and resets it to its initial state.*
- [JsonRef](#) [operator\[\]](#) (int i)  
*Get a [JsonRef](#) from an array by numerical index.*
- [JsonRef](#) [operator\(\)](#) (const char \*name)  
*Get a [JsonRef](#) representing any entity from a parent object by key name.*

- [JsonRef name](#) (const char \*name)  
*Get a [JsonRef](#) representing any entity from a parent object by key name.*
- [JsonRef object](#) (const char \*name)  
*Get a [JsonRef](#) representing an object from a parent object by key name.*
- [JsonRef start](#) ()  
*Begin traversal: check for ref validity and reset the position.*
- [JsonRef next](#) ()  
*Traverse: check for ref validity and increment the position.*
- [json\\_primitive\\_type GetFirst](#) ()  
*Get the first element of the JSON data set.*
- [json\\_primitive\\_type GetNext](#) ()  
*Get the element at the next position of the JSON data set.*
- [json\\_primitive\\_type GetCurrent](#) ()  
*Get the element at the current position of the JSON data set.*
- [json\\_primitive\\_type GetRawCurrent](#) ()  
*Get the element at the current position of the JSON data set, including non-public types.*
- [json\\_primitive\\_type GetNextName](#) ()  
*Iterates the current element of the JSON data set until it finds one of type NAME.*
- [json\\_primitive\\_type GetNextObject](#) ()  
*Get the next element of type name that exists in the current OBJECT after the current position.*
- [json\\_primitive\\_type GetNextArray](#) ()  
*Iterates the current element of the JSON data set until it finds one of type BEGIN\_ARRAY.*
- [json\\_primitive\\_type GetNextNameInCurrentObject](#) ()  
*Get the next element of type NAME that exists in the current OBJECT after the current position.*
- [json\\_primitive\\_type GetNextNameInCurrentArray](#) ()  
*Get the next element of type NAME that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type GetNextNumberInCurrentArray](#) ()  
*Get the next element of type NUMBER that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type GetNextStringInCurrentArray](#) ()  
*Get the next element of type STRING that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type GetNextBoolInCurrentArray](#) ()  
*Get the next element of type TRUE\_EL that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type GetNextObjectInCurrentArray](#) ()  
*Get the next element of type BEGIN\_OBJECT that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type SkipCurrentValue](#) ()  
*Skips over the current value, and get the next element. If called inside an ARRAY or OBJECT, it will walk to the end of the ARRAY or OBJECT and return the next element it finds. If it reaches the end of the ARRAY or OBJECT before it finds a value, it will return NOTFOUND.*
- void [ResetPosition](#) ()  
*Resets the parser position to the beginning of the JSON data set.*
- [JsonRef GetParsePosition](#) ()  
*Gets the current parse position object for the JSON data set.*
- [JsonRef SetParsePosition](#) (JsonRef pos)  
*Sets the current parse position object for the JSON data set.*
- [json\\_primitive\\_type FindFullName](#) (const char \*name)  
*Find the element in the data set with the given name and move the parser to the next element. This searches a full name path, such as ob1.ob2.ob3.ob4.*
- [json\\_primitive\\_type FindFullAtName](#) (const char \*name)  
*Find the element in the data set with the given name and move the parser to that element. This searches a full name path, such as ob1.ob2.ob3.ob4.*

- [json\\_primitive\\_type FindElementAfterName](#) (const char \*name)  
*Finds name in current object points at element after name. This only supports simple, single element names. This searches from the current position to the end.*
- [json\\_primitive\\_type FindGlobalElementAfterName](#) (const char \*name)  
*Finds name in current object points at element after name. This only supports simple, single element names. It starts the search from the parser's current position, and if it doesn't find it, it will start the search over from the beginning.*
- [json\\_primitive\\_type FindElementAfterNameInCurrentObject](#) (const char \*name)  
*Looks for elements with the current name in the current OBJECT only. Does not search sub objects.*
- [json\\_primitive\\_type FindElementAfterNameInCurrentArray](#) (const char \*name)  
*Looks for elements with the current name in the current ARRAY only. Does not search sub arrays.*
- bool [CurrentBool](#) ()  
*Returns true if the current element a TRUE\_EL primitive type.*
- bool [PermissiveCurrentBool](#) ()  
*Returns true if the current element a TRUE\_EL primitive type, is "True", "true", or is a non-zero number.*
- double [CurrentNumber](#) ()  
*Get the number value of the current element.*
- const char \* [CurrentString](#) ()  
*Get the string value of the current element.*
- int [CopyCurrentString](#) (char \*buf, int buflen)  
*Copy the string value of the current element.*
- int [CopyCurrentString](#) (NBString &nbs)  
*Copy the string value of the current element.*
- const char \* [CurrentName](#) ()  
*Get the name of the current element.*
- bool [FindFullNameBoolean](#) (const char \*name)  
*Find the boolean value of a given element.*
- bool [FindGlobalBoolean](#) (const char \*name)  
*Find the boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- bool [FindBoolean](#) (const char \*name)  
*Find the boolean value of the element after the element with the given name.*
- bool [FindBooleanInCurentObject](#) (const char \*name)  
*Find the boolean value of the element within the current object. Does not search sub-objects.*
- bool [FindFullNamePermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of a given element.*
- bool [FindGlobalPermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- bool [FindPermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of the element after the element with the provided name.*
- bool [FindPermissiveBooleanInCurentObject](#) (const char \*name)  
*Find the permissive boolean value of the element with the given name in the current object. Does not search sub-objects.*
- const char \* [FindFullNameString](#) (const char \*name)  
*Find the string value of the element with the given name in the current object.*
- int [FindAndCopyFullNameString](#) (const char \*name, char \*buf, int buflen)  
*Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- int [FindAndCopyFullNameString](#) (const char \*name, NBString &nbs)  
*Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- const char \* [FindGlobalString](#) (const char \*name)

- Find the string value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- int [FindAndCopyGlobalString](#) (const char \*name, char \*buf, int buflen)  
*Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
  - int [FindAndCopyGlobalString](#) (const char \*name, [NBString](#) &nbs)  
*Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
  - const char \* [FindString](#) (const char \*name)  
*Find the string value of the element after the element with the given name.*
  - int [FindAndCopyString](#) (const char \*name, char \*buf, int buflen)  
*Find and copy the string value of the element with the given name. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
  - int [FindAndCopyString](#) (const char \*name, [NBString](#) &nbs)  
*Find and copy the string value of the element with the given name. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
  - const char \* [FindStringInCurentObject](#) (const char \*name)  
*Find the string value of the element with the given name in the current object. Does not search sub-objects.*
  - double [FindFullNameNumber](#) (const char \*name)  
*Find the number value of the element with the given name in the current object.*
  - double [FindGlobalNumber](#) (const char \*name)  
*Find the number value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
  - double [FindNumber](#) (const char \*name)  
*Find the number value of the element after the element with the given name.*
  - double [FindNumberInCurentObject](#) (const char \*name)  
*Find the number value of the element with the given name in the current object. Does not search sub-objects.*
  - bool [FindGlobalObject](#) (const char \*name)  
*Find the OBJECT with the given name. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
  - bool [FindObject](#) (const char \*name)  
*Find the OBJECT of the element after the element with the given name.*
  - bool [FindObjectInCurentObject](#) (const char \*name)  
*Find the OBJECT of the element with the given name in the current OBJECT. Does not search sub-objects.*
  - void **DumpState** ()  
*Outputs what's in the parse tree to stdout.*
  - int [PrintObject](#) (bool pretty=false)  
*Prints the JSON data set to stdout.*
  - int [PrintObjectToBuffer](#) (char \*buffer, int maxlen, bool pretty=false)  
*Prints the JSON data set to a provided buffer.*
  - int [PrintObjectToFd](#) (int fd, bool pretty=false)  
*Prints the JSON data set to a specified file descriptor.*
  - int [PrintObjectToString](#) ([NBString](#) &s, bool pretty=false)  
*Prints the JSON data set to a [NBString](#) object.*
  - int **PrintChildren** (bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to stdout.*
  - int **PrintChildrenToFd** (int fd, bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to a file descriptor.*
  - int **PrintChildrenToBuffer** (char \*buffer, int maxlen, bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to a buffer pointer.*

- `int GetPrintSize (bool pretty=false)`  
*Calculates how many characters the JSON data set would take to print.*
- `ParsedJsonDataSet * StartBuilding ()`  
*Use to start building the JSON data set.*
- `ParsedJsonDataSet * AddObjectStart (const char *name)`  
*Use to start an object in the JSON data set.*
- `ParsedJsonDataSet * AddMyMac (const char *name)`  
*Add the device MAC address to the JSON data set.*
- `ParsedJsonDataSet * Add (const char *name, int i)`  
*Add a name/value pair to the JSON data set where the value is an int.*
- `ParsedJsonDataSet * Add (const char *name, short i)`  
*Add a name/value pair to the JSON data set where the value is a short.*
- `ParsedJsonDataSet * Add (const char *name, long i)`  
*Add a name/value pair to the JSON data set where the value is a long.*
- `ParsedJsonDataSet * Add (const char *name, unsigned int i)`  
*Add a name/value pair to the JSON data set where the value is an unsigned int.*
- `ParsedJsonDataSet * Add (const char *name, unsigned short i)`  
*Add a name/value pair to the JSON data set where the value is a unsigned short.*
- `ParsedJsonDataSet * Add (const char *name, unsigned long i)`  
*Add a name/value pair to the JSON data set where the value is a unsigned long.*
- `ParsedJsonDataSet * Add (const char *name, double d)`  
*Add a name/value pair to the JSON data set where the value is a double.*
- `ParsedJsonDataSet * Add (const char *name, const char *str)`  
*Add a name/value pair to the JSON data set where the value is a string.*
- `ParsedJsonDataSet * Add (const char *name, bool b)`  
*Add a name/value pair to the JSON data set where the value is a bool.*
- `ParsedJsonDataSet * Add (const char *name, IPADDR4 i4)`  
*Add a name/value pair to the JSON data set where the value is an IPv4 address.*
- `ParsedJsonDataSet * Add (const char *name, const IPADDR &i)`  
*Add a name/value pair to the JSON data set where the value is an IP address.*
- `ParsedJsonDataSet * Add (const char *name, const MACADR &ma)`  
*Add a name/value pair to the JSON data set where the value is a MAC address.*
- `ParsedJsonDataSet * AddNull (const char *name)`  
*Add a name/value pair to the JSON data set where the value is null.*
- `ParsedJsonDataSet * AddArrayStart (const char *name)`  
*Add an ARRAY start to the JSON data set.*
- `ParsedJsonDataSet * EndArray ()`  
*Add an ARRAY end to the JSON data set.*
- `ParsedJsonDataSet * AddArrayElement (int i)`  
*Add an integer value to the current array.*
- `ParsedJsonDataSet * AddArrayElement (short i)`  
*Add a short value to the current array.*
- `ParsedJsonDataSet * AddArrayElement (long i)`  
*Add a long value to the current array.*
- `ParsedJsonDataSet * AddArrayElement (unsigned int i)`  
*Add an unsigned int value to the current array.*
- `ParsedJsonDataSet * AddArrayElement (unsigned short i)`  
*Add an unsigned short value to the current array.*
- `ParsedJsonDataSet * AddArrayElement (unsigned long i)`  
*Add an unsigned long value to the current array.*

- [ParsedJsonDataSet](#) \* [AddArrayElement](#) (double d)  
*Add a double to the current array.*
- [ParsedJsonDataSet](#) \* [AddArrayElement](#) (const char \*str)  
*Add a string to the current array.*
- [ParsedJsonDataSet](#) \* [AddArrayElement](#) (bool b)  
*Add a bool to the current array.*
- [ParsedJsonDataSet](#) \* [AddArrayElement](#) (const IPADDR &i)  
*Add an IP address to the current array.*
- [ParsedJsonDataSet](#) \* [AddArrayElementArray](#) ()  
*Add the start of an array element to the current array.*
- [ParsedJsonDataSet](#) \* [AddArrayObjectStart](#) ()  
*Add the start of an object element to the current array.*
- [ParsedJsonDataSet](#) \* [AddNullArrayElement](#) ()  
*Add a null element to the current array.*
- [ParsedJsonDataSet](#) \* [EndObject](#) ()  
*Add an end to the current object.*
- [ParsedJsonDataSet](#) \* [DoneBuilding](#) ()  
*Add an end JSON data set and finish building.*

### 16.112.1 Detailed Description

Get the type name of the JSON primitive type passed in.

#### Parameters

|          |                                             |
|----------|---------------------------------------------|
| <i>t</i> | The JSON primitive type to get the name of. |
|----------|---------------------------------------------|

#### Returns

The name of the JSON primitive type passed in.

The documentation for this class was generated from the following file:

- json\_lexer.h

## 16.113 JsonRef Class Reference

Represents a positional reference (pointer) of a location inside a [ParsedJsonDataSet](#) object.

```
#include <json_lexer.h>
```

### Public Member Functions

#### Querying the Data Structure

*Allows easy retrieval of entities by array index or object key name*

#### Example

```
printf("User %d name %s",
 (int)myJsonRef("users")[0]("id"),
 (const char *)myJsonRef("users")[0]("name")
);
```

- [JsonRef operator\[\]](#) (int i)  
*Get a [JsonRef](#) from an array by numerical index.*
- [JsonRef object](#) (const char \*name)  
*Get a [JsonRef](#) representing an object from a parent object by key name.*
- [JsonRef name](#) (const char \*name)

Get a [JsonRef](#) representing any entity from a parent object by key name.

- [JsonRef operator\(\)](#) (const char \*namev)

Get a [JsonRef](#) representing any entity from a parent object by key name.

## Types and Operators

Allows casting of a [JsonRef](#) to the desired type

### Example

```
bool b = (bool)myJsonRef("user")("isEnabled");
int i = (int)myJsonRef("user")("id");
const char *str = (const char *)myJsonRef("user")("name");
```

- [operator bool](#) () const  
Operator to return a JSON element of type boolean.
- [operator float](#) () const  
Operator to return a JSON element of type float.
- [operator double](#) () const  
Operator to return a JSON element of type double.
- [operator uint8\\_t](#) () const  
Operator to return a JSON element of type uint8\_t.
- [operator int](#) () const  
Operator to return a JSON element of type int.
- [operator uint16\\_t](#) () const  
Operator to return a JSON element of type uint16\_t.
- [operator uint32\\_t](#) () const  
Operator to return a JSON element of type uint32\_t.
- [operator int8\\_t](#) () const  
Operator to return a JSON element of type int8\_t.
- [operator int16\\_t](#) () const  
Operator to return a JSON element of type int16\_t.
- [operator int32\\_t](#) () const  
Operator to return a JSON element of type int32\_t.
- [operator time\\_t](#) () const  
Operator to return a JSON element of type time\_t.
- [operator const char \\*](#) () const  
Operator to return a JSON element of type const char \*.
- [operator NBString](#) () const  
Operator to return a JSON element of type [NBString](#).

## Checking Validity

- bool [IsNumber](#) ()  
Check if the current [JsonRef](#) is a valid JSON number element.
- bool [IsObject](#) ()  
Check if the current [JsonRef](#) is a valid JSON object element.
- bool [IsString](#) ()  
Check if the current [JsonRef](#) is a valid JSON string element.
- bool [IsBool](#) ()  
Check if the current [JsonRef](#) is a valid JSON boolean element.
- bool [IsNull](#) ()  
Check if the current [JsonRef](#) is a valid JSON null element.
- bool [IsArray](#) ()  
Check if the current [JsonRef](#) is a valid JSON array element.
- bool [Valid](#) () const  
Check if the current [JsonRef](#) is a valid JSON position.

## Traversing the Data Structure

- [JsonRef start](#) ()  
Begin traversal: check for ref validity and reset the position.

- **JsonRef next ()** const  
*Traverse: check for ref validity and increment the position.*
- **bool IncPosition ()**  
*Increment the position index of the [ParsedJsonDataSet](#).*
- **bool JumpPosition (int siz)**  
*Jump to a specific position index in the [ParsedJsonDataSet](#).*
- **void ResetPosition ()**  
*Reset the position index of the [ParsedJsonDataSet](#) to the beginning.*
- **void SkipElement ()**  
*Increment the position index of the [ParsedJsonDataSet](#) beyond this element.*
- **void SkipArray ()**  
*Increment the position index of the [ParsedJsonDataSet](#) beyond this array.*
- **void SkipObject ()**  
*Increment the position index of the [ParsedJsonDataSet](#) beyond this object.*

### Utility

- **int PrintChildren (bool pretty=false)**  
*Output child objects of this [JsonRef](#) as JSON text to stdout.*
- **int PrintChildrenToFd (int fd, bool pretty=false)**  
*Output child objects of this [JsonRef](#) as JSON text to a file descriptor.*
- **int PrintChildrenToBuffer (char \*buffer, int maxlen, bool pretty=false)**  
*Output child objects of this [JsonRef](#) as JSON text to a buffer pointer.*
- **int PrintChildrenToString (NBString &s, bool pretty=false)**  
*Output child objects of this [JsonRef](#) as JSON text to a [NBString](#).*
- **int GetChildPrintSize (bool pretty=false)**  
*Return the length of the child objects' JSON text as written with the [PrintChildren\\*](#) functions.*
- **void DiagDump (const char \*lab)**  
*Output a verbose diagnostic report of the [ParsedJsonDatSet](#) to stdout.*
- **void MakeInvalid ()**

### Friends

- class **ParsedJsonDataSet**

## 16.113.1 Detailed Description

Represents a positional reference (pointer) of a location inside a [ParsedJsonDataSet](#) object.

A [JsonRef](#) can be used as a pointer to a variable or sub object inside a [ParsedJsonDataSet](#) object to make decoding the hierarchy much simpler and easier to understand. A [JsonRef](#) is not limited to just pointing at internal objects; it can point to any JSON parsed token/type.

## 16.113.2 Member Function Documentation

### 16.113.2.1 GetChildPrintSize()

```
int JsonRef::GetChildPrintSize (
 bool pretty = false)
```

Return the length of the child objects' JSON text as written with the [PrintChildren\\*](#) functions.

#### Parameters

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <i>pretty</i> | Whether indentation and new lines should be provided between elements. |
|---------------|------------------------------------------------------------------------|

#### Returns

The number of characters needed to print the JSON data set.

#### 16.113.2.2 IsArray()

```
bool JsonRef::IsArray () [inline]
```

Check if the current [JsonRef](#) is a valid JSON array element.

##### Returns

True if parsed JSON element is an array, otherwise false.

#### 16.113.2.3 IsBool()

```
bool JsonRef::IsBool () [inline]
```

Check if the current [JsonRef](#) is a valid JSON boolean element.

##### Returns

True if parsed JSON element is a boolean, otherwise false.

#### 16.113.2.4 IsNull()

```
bool JsonRef::IsNull () [inline]
```

Check if the current [JsonRef](#) is a valid JSON null element.

##### Returns

True if parsed JSON element is a null, otherwise false.

#### 16.113.2.5 IsNumber()

```
bool JsonRef::IsNumber () [inline]
```

Check if the current [JsonRef](#) is a valid JSON number element.

##### Returns

True if parsed JSON element is a number, otherwise false.

#### 16.113.2.6 IsObject()

```
bool JsonRef::IsObject () [inline]
```

Check if the current [JsonRef](#) is a valid JSON object element.

##### Returns

True if parsed JSON element is an object, otherwise false.

#### 16.113.2.7 IsString()

```
bool JsonRef::IsString () [inline]
```

Check if the current [JsonRef](#) is a valid JSON string element.

##### Returns

True if parsed JSON element is a string, otherwise false. A string can be of type `char *`, or a [NBString](#) object.

#### 16.113.2.8 MakeInvalid()

```
void JsonRef::MakeInvalid () [inline]
```

### 16.113.2.9 name()

```
JsonRef JsonRef::name (
 const char * name)
```

Get a [JsonRef](#) representing any entity from a parent object by key name. Useful if more than one JSON object/element has the same name.

#### Example

```
JsonRef userThree = myJsonRef.name("users")[3];
```

#### Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>*name</i> | Pointer to name of the entity to find |
|--------------|---------------------------------------|

#### Returns

The reference to the entity of type [JsonRef](#)

#### See also

[JsonRef::operator\(\)\(\)](#), [JsonRef::object\(\)](#)

### 16.113.2.10 object()

```
JsonRef JsonRef::object (
 const char * name) [inline]
```

Get a [JsonRef](#) representing an object from a parent object by key name.

#### Example

```
JsonRef john = myJsonRef.object("users").object("john");
```

#### Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>*name</i> | Pointer to name of the object to find |
|--------------|---------------------------------------|

#### Returns

The reference to the object of type [JsonRef](#)

### 16.113.2.11 operator bool()

```
JsonRef::operator bool () const [inline]
```

Operator to return a JSON element of type boolean.

#### Returns

Boolean value

### 16.113.2.12 operator const char \*()

```
JsonRef::operator const char * () const [inline]
```

Operator to return a JSON element of type const char \*.

#### Returns

const char \* value

**16.113.2.13 operator double()**

```
JsonRef::operator double () const [inline]
```

Operator to return a JSON element of type double.

**Returns**

double value

**16.113.2.14 operator float()**

```
JsonRef::operator float () const [inline]
```

Operator to return a JSON element of type float.

**Returns**

float value

**16.113.2.15 operator int()**

```
JsonRef::operator int () const [inline]
```

Operator to return a JSON element of type int.

**Returns**

integer value

**16.113.2.16 operator int16\_t()**

```
JsonRef::operator int16_t () const [inline]
```

Operator to return a JSON element of type int16\_t.

**Returns**

int16\_t value

**16.113.2.17 operator int32\_t()**

```
JsonRef::operator int32_t () const [inline]
```

Operator to return a JSON element of type int32\_t.

**Returns**

int32\_t value

**16.113.2.18 operator int8\_t()**

```
JsonRef::operator int8_t () const [inline]
```

Operator to return a JSON element of type int8\_t.

**Returns**

int8\_t value

**16.113.2.19 operator NSString()**

```
JsonRef::operator NSString () const [inline]
```

Operator to return a JSON element of type [NSString](#).

**Returns**

[NSString](#) object

**16.113.2.20 operator time\_t()**

```
JsonRef::operator time_t () const [inline]
```

Operator to return a JSON element of type `time_t`.

**Returns**

`time_t` value

**16.113.2.21 operator uint16\_t()**

```
JsonRef::operator uint16_t () const [inline]
```

Operator to return a JSON element of type `uint16_t`.

**Returns**

`uint16_t` value

**16.113.2.22 operator uint32\_t()**

```
JsonRef::operator uint32_t () const [inline]
```

Operator to return a JSON element of type `uint32_t`.

**Returns**

`uint32_t` value

**16.113.2.23 operator uint8\_t()**

```
JsonRef::operator uint8_t () const [inline]
```

Operator to return a JSON element of type `uint8_t`.

**Returns**

`uint8_t` value

**16.113.2.24 operator>()()**

```
JsonRef JsonRef::operator() (
 const char * namev) [inline]
```

Get a [JsonRef](#) representing any entity from a parent object by key name.  
Shortcut for [JsonRef::name\(\)](#)

**Example**

```
JsonRef allUsers = myJsonRef("users");
```

**Parameters**

|               |                                       |
|---------------|---------------------------------------|
| <i>*namev</i> | Pointer to name of the entity to find |
|---------------|---------------------------------------|

**Returns**

The reference to the entity of type [JsonRef](#)

**See also**

[JsonRef::name\(\)](#), [JsonRef::object\(\)](#)

**16.113.2.25 operator[]()**

```
JsonRef JsonRef::operator[] (
 int i)
```

Get a [JsonRef](#) from an array by numerical index.

**Example**

```
JsonRef userThree = myJsonRef("users")[3];
```

**Returns**

A [JsonRef](#) if array element is found

**16.113.2.26 Valid()**

```
bool JsonRef::Valid () const [inline]
```

Check if the current [JsonRef](#) is a valid JSON position.

**Returns**

True if a JSON element exists, otherwise false.

The documentation for this class was generated from the following file:

- [json\\_lexer.h](#)

**16.114 DHCP::LeaseAllocator Class Reference**

Base class/interface for lease allocators for the [DHCP](#) server.

```
#include <dhcpd.h>
```

Inherited by [DHCP::BlockAllocator](#), [DHCP::SingleAllocator](#), and [SpecialAllocator](#).

**16.114.1 Detailed Description**

Base class/interface for lease allocators for the [DHCP](#) server.

The documentation for this class was generated from the following file:

- [dhcpd.h](#)

**16.115 LetsEncryptAcmeServletObject Class Reference**

ACME Client for Let's Encrypt.

```
#include <acmeRFC8555Servlet.h>
```

Inherits [AcmeServletObject](#).

**Public Member Functions**

- [LetsEncryptAcmeServletObject](#) (const bool useStaging=false)  
*Enable the Let's Encrypt ACME client.*

**Public Member Functions inherited from [AcmeServletObject](#)**

- void [Delete\\_Everything\\_Restart](#) ()  
*Re-request the ACME certificate.*
- void [SetDiag](#) (bool v)  
*Turn on diagnostic printf messages to the console.*
- [NBString](#) [GetGlobalStateString](#) ()  
*Returns the detailed state of the ACME process.*

- [NSString](#) **GetStateString** ()  
*Returns the specific state condition of the acmeservlet.*
- const char \* [GetStateCC](#) ()  
*Returns the specific state condition of the acmeservlet.*
- [AcmeServletObject](#) (const char \*pUrlDir)  
*ACME Client Constructor.*

### 16.115.1 Detailed Description

ACME Client for Let's Encrypt.

### 16.115.2 Constructor & Destructor Documentation

#### 16.115.2.1 LetsEncryptAcmeServletObject()

```
LetsEncryptAcmeServletObject::LetsEncryptAcmeServletObject (
 const bool useStaging = false) [inline]
```

Enable the Let's Encrypt ACME client.

#### Parameters

|                   |                                                                                      |
|-------------------|--------------------------------------------------------------------------------------|
| <i>useStaging</i> | Optional boolean to use the Let's Encrypt staging server for testing (default false) |
|-------------------|--------------------------------------------------------------------------------------|

The documentation for this class was generated from the following file:

- acmeRFC8555Servlet.h

## 16.116 listen\_list\_item Struct Reference

Structure to use to create custom lists of listentiing ports and interfaces.

```
#include <init.h>
```

### 16.116.1 Detailed Description

Structure to use to create custom lists of listentiing ports and interfaces.

If you want to control what sockets and or interfaces are used for the http(s) server Then make a global or static array of these structures. One of each combination of port and interface you want. open the listening socket (with whatever port, interface optiosn you want) and assign it to the fd\_listen member. Also set if this is supposed to use TLS.

Lasttly make one extra entry in the array with a zero fd\_listen to terminate the list.

#### Parameters

|                  |                                                              |
|------------------|--------------------------------------------------------------|
| <i>fd_listen</i> | The actiaon FD opened by listen or listen via for this entry |
| <i>bUseTls</i>   | true if you wnat this socket to use tls                      |

The documentation for this struct was generated from the following file:

- init.h

## 16.117 MACADR Class Reference

Used to store and manipulate MAC addresses.

```
#include <nettypes.h>
```

## Public Member Functions

- bool **IsNull** ()  
*Checks if MAC is null.*
- bool **IsMultiCast** ()  
*Checks if MAC is a Multicast MAC.*
- bool **IsBroadCast** ()  
*Checks if MAC is a Broadcast MAC.*
- uint8\_t **GetByte** (int n) const  
*Get the nth byte of the MAC.*
- void **SetFromBytes** (const uint8\_t \*pb)  
*Set the MAC Address from a pointer to an array of 6 bytes.*
- void **fdprint** (int fd)  
*print the MAC to a file descriptor*
- void **print** ()  
*print the MAC to file descriptor 1*
- [MACADR operator+](#) (uint32\_t rhs)

### 16.117.1 Detailed Description

Used to store and manipulate MAC addresses.

### 16.117.2 Member Function Documentation

#### 16.117.2.1 operator+()

```
MACADR MACADR::operator+ (
 uint32_t rhs) [inline]
```

The documentation for this class was generated from the following file:

- nettypes.h

## 16.118 DHCP::MacPrefixAllocator Class Reference

Derived from [BlockAllocator](#) Has the ability to whitelist/blacklist certain mac address ranges based on a mask. Useful for allocating addresses based on device manufacturer.

```
#include <dhcpcd.h>
```

Inherits [DHCP::BlockAllocator](#).

### 16.118.1 Detailed Description

Derived from [BlockAllocator](#) Has the ability to whitelist/blacklist certain mac address ranges based on a mask. Useful for allocating addresses based on device manufacturer.

The documentation for this class was generated from the following file:

- dhcpcd.h

## 16.119 mcanMODM7AE70::mcan\_config Class Reference

MCAN configuration structure.

```
#include <mcan.h>
```

## Public Member Functions

- void [set\\_config\\_defaults](#) ()  
*Initializes an MCAN configuration structure to defaults.*

**Public Attributes**

- bool [run\\_in\\_standby](#)
- uint8\_t [watchdog\\_configuration](#)
- bool [transmit\\_pause](#)
- bool [edge\\_filtering](#)

- uint32\_t [extended\\_id\\_mask](#)
- bool [rx\\_fifo\\_0\\_overwrite](#)
- uint8\_t [rx\\_fifo\\_0\\_watermark](#)
- bool [rx\\_fifo\\_1\\_overwrite](#)
- uint8\_t [rx\\_fifo\\_1\\_watermark](#)
- bool [tx\\_queue\\_mode](#)
- uint8\_t [tx\\_event\\_fifo\\_watermark](#)

**16.119.1 Detailed Description**

MCAN configuration structure.

Configuration structure for an MCAN instance. This structure should be initialized by the `mcan_get_config_defaults()` function before being modified by the user application.

**16.119.2 Member Function Documentation****16.119.2.1 set\_config\_defaults()**

```
void mcanMODM7AE70::mcan_config::set_config_defaults () [inline]
```

Initializes an MCAN configuration structure to defaults.

Initializes a given MCAN configuration struct to a set of known default values. This function should be called on any new instance of the configuration struct before being modified by the user application.

The default configuration is as follows:

- Not run in standby mode
- Disable Watchdog
- Transmit pause enabled
- Edge filtering during bus integration enabled
- Protocol exception handling enabled
- Automatic retransmission enabled
- Clock stop request disabled
- Clock stop acknowledge disabled

- Timestamp Counter Prescaler 1
- Timeout Period with 0xFFFF
- Timeout Mode: Continuous operation
- Disable Timeout
- Transmitter Delay Compensation Offset is 0
- Transmitter Delay Compensation Filter Window Length is 0
- Reject nonmatching standard frames
- Reject nonmatching extended frames
- Reject remote standard frames
- Reject remote extended frames
- Extended ID Mask is 0x1FFFFFFF
- Rx FIFO 0 Operation Mode: overwrite
- Disable Rx FIFO 0 Watermark
- Rx FIFO 1 Operation Mode: overwrite
- Disable Rx FIFO 1 Watermark
- Tx FIFO/Queue Mode: FIFO
- Disable Tx Event FIFO Watermark

### 16.119.3 Member Data Documentation

#### 16.119.3.1 automatic\_retransmission

`bool mcanMODM7AE70::mcan_config::automatic_retransmission`  
Automatic Retransmission.

#### 16.119.3.2 clock\_stop\_acknowledge

`bool mcanMODM7AE70::mcan_config::clock_stop_acknowledge`  
Clock Stop Acknowledge.

#### 16.119.3.3 clock\_stop\_request

`bool mcanMODM7AE70::mcan_config::clock_stop_request`  
Clock Stop Request.

#### 16.119.3.4 delay\_compensation\_filter\_window\_length

`uint8_t mcanMODM7AE70::mcan_config::delay_compensation_filter_window_length`  
Transmitter Delay Compensation Filter Window Length : 0x0-0x7F

#### 16.119.3.5 delay\_compensation\_offset

`uint8_t mcanMODM7AE70::mcan_config::delay_compensation_offset`  
Transmitter Delay Compensation Offset : 0x0-0x7F

#### 16.119.3.6 edge\_filtering

`bool mcanMODM7AE70::mcan_config::edge_filtering`  
Edge Filtering during Bus Integration.

### 16.119.3.7 extended\_id\_mask

uint32\_t mcanMODM7AE70::mcan\_config::extended\_id\_mask  
Extended ID Mask: 0x0-0x1FFFFFFF.

### 16.119.3.8 nonmatching\_frames\_action\_extended

enum [mcan\\_nonmatching\\_frames\\_action](#) mcanMODM7AE70::mcan\_config::nonmatching\_frames\_action\_↵  
extended  
Nonmatching frames action for extended frames.

### 16.119.3.9 nonmatching\_frames\_action\_standard

enum [mcan\\_nonmatching\\_frames\\_action](#) mcanMODM7AE70::mcan\_config::nonmatching\_frames\_action\_↵  
standard  
Nonmatching frames action for standard frames.

### 16.119.3.10 protocol\_exception\_handling

bool mcanMODM7AE70::mcan\_config::protocol\_exception\_handling  
Protocol Exception Handling.

### 16.119.3.11 remote\_frames\_extended\_reject

bool mcanMODM7AE70::mcan\_config::remote\_frames\_extended\_reject  
Reject Remote Extended Frames.

### 16.119.3.12 remote\_frames\_standard\_reject

bool mcanMODM7AE70::mcan\_config::remote\_frames\_standard\_reject  
Reject Remote Standard Frames.

### 16.119.3.13 run\_in\_standby

bool mcanMODM7AE70::mcan\_config::run\_in\_standby  
MCAN run in standby control.

### 16.119.3.14 rx\_fifo\_0\_overwrite

bool mcanMODM7AE70::mcan\_config::rx\_fifo\_0\_overwrite  
Rx FIFO 0 Operation Mode.

### 16.119.3.15 rx\_fifo\_0\_watermark

uint8\_t mcanMODM7AE70::mcan\_config::rx\_fifo\_0\_watermark  
Rx FIFO 0 Watermark: 1-64, other value disable it.

### 16.119.3.16 rx\_fifo\_1\_overwrite

bool mcanMODM7AE70::mcan\_config::rx\_fifo\_1\_overwrite  
Rx FIFO 1 Operation Mode.

### 16.119.3.17 rx\_fifo\_1\_watermark

uint8\_t mcanMODM7AE70::mcan\_config::rx\_fifo\_1\_watermark  
Rx FIFO 1 Watermark: 1-64, other value disable it.

### 16.119.3.18 tdc\_enable

bool mcanMODM7AE70::mcan\_config::tdc\_enable  
Transceiver Delay Compensation enable.

**16.119.3.19 timeout\_enable**

bool mcanMODM7AE70::mcan\_config::timeout\_enable  
Timeout enable.

**16.119.3.20 timeout\_mode**

enum mcan\_timeout\_mode mcanMODM7AE70::mcan\_config::timeout\_mode  
Timeout Mode.

**16.119.3.21 timeout\_period**

uint16\_t mcanMODM7AE70::mcan\_config::timeout\_period  
Timeout Period.

**16.119.3.22 timestamp\_prescaler**

uint8\_t mcanMODM7AE70::mcan\_config::timestamp\_prescaler  
Timestamp Counter Prescaler: 0x0-0xF

**16.119.3.23 transmit\_pause**

bool mcanMODM7AE70::mcan\_config::transmit\_pause  
Transmit Pause.

**16.119.3.24 tx\_event\_fifo\_watermark**

uint8\_t mcanMODM7AE70::mcan\_config::tx\_event\_fifo\_watermark  
Tx Event FIFO Watermark: 1-32, other value disable it.

**16.119.3.25 tx\_queue\_mode**

bool mcanMODM7AE70::mcan\_config::tx\_queue\_mode  
Tx FIFO/Queue Mode, 0 for FIFO and 1 for Queue.

**16.119.3.26 watchdog\_configuration**

uint8\_t mcanMODM7AE70::mcan\_config::watchdog\_configuration  
Start value of the Message RAM Watchdog Counter  
The documentation for this class was generated from the following file:

- mcan.h

**16.120 mcan\_extended\_message\_filter\_element Class Reference**

MCAN extended message ID filter element structure.

```
#include <mcan_internal.h>
```

**16.120.1 Detailed Description**

MCAN extended message ID filter element structure.

Common element structure for extended message ID filter element.

The documentation for this class was generated from the following file:

- mcan\_internal.h

**16.121 mcanMODM7AE70::mcan\_module Class Reference**

MCAN Module Class.

```
#include <mcan.h>
```

## Public Member Functions

- [mcan\\_module](#) (Mcan \*phw, uint32\_t baud)  
*Create a MCAN module instance.*
- void [init](#) (Mcan \*phw, struct [mcan\\_config](#) \*config, uint32\_t baud)  
*Initialize a MCAN module.*
- void [send\\_message](#) (uint32\_t id\_value, uint8\_t \*data, uint32\_t data\_length, OS\_SEM \*pSem=0)  
*Send a MCAN message.*

*Unregister the RTR message for the specified channel.*

### 16.121.1 Detailed Description

MCAN Module Class.

Class to control a MCAN modules (peripherals) on the MODM7AE70

### 16.121.2 Constructor & Destructor Documentation

#### 16.121.2.1 mcan\_module()

```
mcanMODM7AE70::mcan_module::mcan_module (
 Mcan * phw,
 uint32_t baud)
```

Create a MCAN module instance.

#### Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>phw</i>  | MCAN hardware peripheral, MCAN0 or MCAN 1 |
| <i>baud</i> | MCAN baud rate. For example, 500000       |

### 16.121.3 Member Function Documentation

#### 16.121.3.1 blocking\_send\_message()

```
bool mcanMODM7AE70::mcan_module::blocking_send_message (
 uint32_t id_value,
 uint8_t * data,
```

```
uint32_t data_length,
uint32_t TimeOut)
```

Send a MCAN message and block until sent.

## Parameters

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <i>id_value</i>    | CAN ID, 11-bit standard or 29-bit extended                             |
| <i>data</i>        | Pointer to message data                                                |
| <i>data_length</i> | Length of data in bytes                                                |
| <i>TimeOut</i>     | Time out value in system time ticks. For example, TICKS_PER_SECOND * 1 |

## 16.121.3.2 init()

```
void mcanMODM7AE70::mcan_module::init (
 Mcan * phw,
 struct mcan_config * config,
 uint32_t baud)
```

Initialize a MCAN module.

## Parameters

|               |                                                                                       |
|---------------|---------------------------------------------------------------------------------------|
| <i>phw</i>    | MCAN hardware peripheral, MCAN0 or MCAN 1                                             |
| <i>config</i> | Pointer to a <a href="#">mcan_config</a> object, initialized with appropriate values. |
| <i>baud</i>   | MCAN baud rate. For example, 500000                                                   |

## 16.121.3.3 MultiCanReplaceRTRMessage()

```
int mcanMODM7AE70::mcan_module::MultiCanReplaceRTRMessage (
 int channel,
 uint8_t * data,
 uint8_t len)
```

Modifies/updates the response for the RTR message registered with [MultiCanSetRTRMessage\(\)](#).

## Returns

The channel number registered for the RTR message.

## See also

[MultiCanSetRTRMessage\(\)](#), [MultiCanStopRTRMessage\(\)](#)

## 16.121.3.4 MultiCanSetRTRMessage()

```
int mcanMODM7AE70::mcan_module::MultiCanSetRTRMessage (
 uint32_t id,
 uint8_t * data,
 uint8_t len,
 int channel = -1)
```

Enable an auto-reply to a CAN RTR message for the specified CAN ID. The reply message is specified by the data parameter.

The response message can be modified with [MultiCanReplaceRTRMessage\(\)](#).

## Parameters

|                |                                            |
|----------------|--------------------------------------------|
| <i>id</i>      | CAN ID, 11-bit standard or 29-bit extended |
| <i>data</i>    | Pointer to message data                    |
| <i>len</i>     | Length of message                          |
| <i>channel</i> | Optional CAN channel                       |

**Returns**

The channel number corresponding to the ID and RTR message.

**See also**

[MultiCanReplaceRTRMessage\(\)](#), [MultiCanStopRTRMessage\(\)](#)

**16.121.3.5 MultiCanStopRTRMessage()**

```
int mcanMODM7AE70::mcan_module::MultiCanStopRTRMessage (
 int channel)
```

Unregister the RTR message for the specified channel.

**Parameters**

|                |                    |
|----------------|--------------------|
| <i>channel</i> | CAN channel number |
|----------------|--------------------|

**Returns**

OS\_NO\_ERR on success

**See also**

[MultiCanSetRTRMessage\(\)](#), [MultiCanReplaceRTRMessage\(\)](#)

**16.121.3.6 RegisterRxFifo()**

```
int mcanMODM7AE70::mcan_module::RegisterRxFifo (
 uint32_t composite_id,
 OS_FIFO * pFifo,
 int channel = -1)
```

Register a FIFO to receive CAN messages.

**Parameters**

|                     |                                            |
|---------------------|--------------------------------------------|
| <i>composite_id</i> | CAN ID, 11-bit standard or 29-bit extended |
| <i>pFifo</i>        | Pointer to OS_FIFO for received data       |
| <i>channel</i>      | Optional CAN channel                       |

**Returns**

OS\_NO\_ERR on success

**16.121.3.7 RegisterRxFifoMask()**

```
int mcanMODM7AE70::mcan_module::RegisterRxFifoMask (
 uint32_t composite_id,
 uint32_t mask,
 OS_FIFO * pFifo,
 int channel = -1)
```

Register a FIFO to receive messages as specified by the address bit mask. A value of 1 = match, a value of 0 = does not match.

## Parameters

|                     |                                            |
|---------------------|--------------------------------------------|
| <i>composite_id</i> | CAN ID, 11-bit standard or 29-bit extended |
| <i>mask</i>         | Id mask                                    |
| <i>pFifo</i>        | Pointer to OS_FIFO for received data       |
| <i>channel</i>      | Optional CAN channel                       |

## Returns

OS\_NO\_ERR on success

**16.121.3.8 RegisterRxFifoRange()**

```
int mcanMODM7AE70::mcan_module::RegisterRxFifoRange (
 uint32_t composite_id_low,
 uint32_t composite_id_hi,
 OS_FIFO * pFifo,
 int channel = -1)
```

Register a FIFO to receive messages in the specified numeric range of addresses from low to high.

## Parameters

|                         |                                      |
|-------------------------|--------------------------------------|
| <i>composite_id_low</i> | Composite ID low value               |
| <i>composite_id_hi</i>  | Composite ID high value              |
| <i>pFifo</i>            | Pointer to OS_FIFO for received data |
| <i>channel</i>          | Optional CAN channel                 |

## Returns

OS\_NO\_ERR on success

**16.121.3.9 send\_message()**

```
void mcanMODM7AE70::mcan_module::send_message (
 uint32_t id_value,
 uint8_t * data,
 uint32_t data_length,
 OS_SEM * pSem = 0)
```

Send a MCAN message.

## Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <i>id_value</i>    | CAN ID, 11-bit standard or 29-bit extended                   |
| <i>data</i>        | Pointer to message data                                      |
| <i>data_length</i> | Length of data in bytes                                      |
| <i>pSem</i>        | Optional pointer to semaphore to post to, default is no post |

**16.121.3.10 UnRegisterFifo()**

```
int mcanMODM7AE70::mcan_module::UnRegisterFifo (
 int channel)
```

Unregister the FIFO for the specified CAN channel.

**Parameters**

|                |                    |
|----------------|--------------------|
| <i>channel</i> | CAN channel number |
|----------------|--------------------|

**Returns**

OS\_NO\_ERR on success

The documentation for this class was generated from the following file:

- mcan.h

## 16.122 mcan\_rx\_element\_buffer Struct Reference

MCAN receive element structure for buffer.

```
#include <mcan_internal.h>
```

### 16.122.1 Detailed Description

MCAN receive element structure for buffer.

The documentation for this struct was generated from the following file:

- mcan\_internal.h

## 16.123 mcan\_tx\_element Struct Reference

MCAN transfer element structure.

```
#include <mcan_internal.h>
```

### 16.123.1 Detailed Description

MCAN transfer element structure.

Common element structure for transfer buffer and FIFO/QUEUE.

The documentation for this struct was generated from the following file:

- mcan\_internal.h

## 16.124 mcan\_tx\_event\_element Struct Reference

MCAN transfer event FIFO element structure.

```
#include <mcan_internal.h>
```

### 16.124.1 Detailed Description

MCAN transfer event FIFO element structure.

Common element structure for transfer event FIFO.

The documentation for this struct was generated from the following file:

- mcan\_internal.h

## 16.125 MQTT::mqtt\_bool Class Reference

Easy MqttObj class for automatically publishing and subscribing boolean values to/from an [MQTT](#) topic. Use like a normal bool.

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

## Public Member Functions

- [mqtt\\_bool](#) (bool val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=(eObj\_Flag\_PubOnWrite|eObj\_Flag\_Subscribe|eObj\_Flag\_Su)  
*Constructor for a standalone [mqtt\\_bool](#) object.*
- [mqtt\\_bool](#) (const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=(eObj\_Flag\_PubOnWrite|eObj\_Flag\_Subscribe|eObj\_Flag\_Su)  
*Constructor for a standalone [mqtt\\_bool](#) object.*
- [mqtt\\_bool](#) ([mqtt\\_leaf](#) &parent, bool val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=(eObj\_Flag\_PubOnWrite|eObj\_Flag\_Su)  
*Constructor for a [mqtt\\_bool](#) object that has a parent.*
- [mqtt\\_bool](#) ([mqtt\\_leaf](#) &parent, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=(eObj\_Flag\_PubOnWrite|eObj\_Flag\_Su)  
*Constructor for a [mqtt\\_bool](#) object that has a parent.*
- [mqtt\\_bool](#) & operator= (bool i)  
*Assignment operator for [mqtt\\_bool](#). Assigns the value to the object, then performs any post assignment operations.*
- [operator bool](#) () const  
*Boolean conversion operator for [mqtt\\_bool](#). Returns the value of the object as an boolean.*
- [bool operator!](#) () const  
*Boolean Not operator for [mqtt\\_bool](#). Returns the negated value of the object as an boolean.*
- virtual [ValueTestResult TestOrSetValue](#) ([ParsedJsonDataSet](#) &pjs, bool setVal) override  
*whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.*
- virtual [int SubscribeEvent](#) ([int](#) mqttFd, [PacketInfo::Msg](#) \*msg) override  
*Handle a message sent by the Broker triggered by this object's Subscription.*
- virtual [int RenderToBuffer](#) ([eObj\\_Serialize\\_t](#) form, [uint8\\_t](#) \*buf, [int](#) buflen) override  
*Render this object to an output buffer.*
- virtual [int RenderToFd](#) ([eObj\\_Serialize\\_t](#) form, [int](#) fd) override  
*Render this object to an output socket.*

Public Member Functions inherited from [MQTT::mqtt\\_leaf](#)

- [~mqtt\\_leaf](#) ()  
*~mqtt\_leaf Destructor for base [mqtt\\_leaf](#)*
- void [RemoveFromTree](#) ()  
*Remove this object from it's parent tree.*
- [bool NameMatch](#) (const char \*cp)  
*Determine whether a given name matches this object.*
- virtual [int GetPubTopicName](#) ([NBString](#) &s)  
*Get the Topic Name this object Publishes to.*
- virtual [int GetSubTopicFilter](#) ([NBString](#) &s)  
*Get the Subscription Topic Filter this object Subscribes to.*
- virtual [int GetRenderLength](#) ([eObj\\_Serialize\\_t](#) form=[eObj\\_Serialize\\_CURRENT\\_FORM](#))  
*Get the number of bytes used to serialize this object in a particular format.*
- [int Publish](#) ([int](#) waitForCompletion=-1)  
*Publishes the current [MQTT](#) object, optionally waiting for completion.*
- void [SetPublishInterval](#) ([uint32\\_t](#) intervalPeriodTicks)  
*Sets or clears an automatic publishing interval for this [MQTT](#) object.*
- virtual void [SetSerializationForm](#) ([eObj\\_Serialize\\_t](#) form)  
*Set the default serialization format for this object.*
- [eObj\\_Serialize\\_t GetSerializationForm](#) ()  
*Get the default serialization format for this object.*
- virtual void [SetFlags](#) ([uint16\\_t](#) newFlags)  
*Set additional behavioral flags for this object.*
- virtual void [ClearFlags](#) ([uint16\\_t](#) delFlags)  
*Clear behavioral flags from this object.*

- uint16\_t [GetFlags](#) ()  
*Get the behavioral flags set for this object.*
- int [getPriority](#) ()  
*Get the message priority for this object.*

### Protected Member Functions

- virtual int [ParseFd](#) (int mqttFd) override  
*the data from a file descriptor according to this object's current default serialization method and assign the value.*

*Get the Subscribe state of this object.*
- virtual void [SetPubState](#) (uint8\_t newState)  
*Set the Publish state.*
- virtual void [SetSubState](#) (uint8\_t newState)  
*Set the Subscribe state.*
- int [HandleSubAck](#) (int mqttFd, [PacketInfo::Msg](#) \*msg)  
*Handle a Subscribe Acknowledge message from the broker for our Subscribe request.*
- int [HandleUnsubAck](#) (int mqttFd, [PacketInfo::Msg](#) \*msg)  
*Handle an Unsubscribe Acknowledge message from the broker for our Unsubscribe request.*
- int [HandlePubAck](#) (int mqttFd, [PacketInfo::Msg](#) \*msg)  
*Handle an Publish Acknowledge message from the broker for our Publish request.*

## Additional Inherited Members

### Public Types inherited from MQTT::mqtt\_leaf

- enum [eObj\\_State\\_t](#)  
*Mqtt Object Publication/Subscription States.*

### Static Public Member Functions inherited from MQTT::mqtt\_leaf

- static int [MqttRxPublish](#) ([Client](#) \*mClient, int mqttFd, [PacketInfo::Msg](#) \*msg, void \*ctx)  
*Static message handler for Publish messages received by the registered [Client](#).*

### Protected Attributes inherited from MQTT::mqtt\_leaf

- [NBInterpolatedString](#) **topicName**  
*Topic name or additional branch.*
- [eObj\\_Serialize\\_t](#) **publishForm**  
*Default serialization form.*
- uint16\_t **mFlags**  
*Behavioral flags.*

## 16.125.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing boolean values to/from an [MQTT](#) topic. Use like a normal bool.

## 16.125.2 Constructor & Destructor Documentation

### 16.125.2.1 mqtt\_bool() [1/4]

```
MQTT::mqtt_bool::mqtt_bool (
 bool val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_bool](#) object.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>      | Initial value for the boolean                                                                                                      |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

### 16.125.2.2 mqtt\_bool() [2/4]

```
MQTT::mqtt_bool::mqtt_bool (
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_bool](#) object.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |

|              |                                               |
|--------------|-----------------------------------------------|
| <i>flags</i> | Behavioral flags to set on the created object |
|--------------|-----------------------------------------------|

### 16.125.2.3 mqtt\_bool() [3/4]

```
MQTT::mqtt_bool::mqtt_bool (
 mqtt_leaf & parent,
 bool val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_bool](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the boolean                                                                                                      |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

### 16.125.2.4 mqtt\_bool() [4/4]

```
MQTT::mqtt_bool::mqtt_bool (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_bool](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.125.3 Member Function Documentation

### 16.125.3.1 operator bool()

```
MQTT::mqtt_bool::operator bool () const [inline]
```

Boolean conversion operator for [mqtt\\_bool](#). Returns the value of the object as an boolean.

#### Returns

The boolean value of the object

### 16.125.3.2 operator"!()"

```
bool MQTT::mqtt_bool::operator! () const [inline]
```

Boolean Not operator for [mqtt\\_bool](#). Returns the negated value of the object as an boolean.

#### Returns

The negated boolean value of the object

### 16.125.3.3 operator=()

```
mqtt_bool & MQTT::mqtt_bool::operator= (
 bool i)
```

Assignment operator for [mqtt\\_bool](#). Assigns the value to the object, then performs any post assignment operations.

#### Parameters

|          |                                    |
|----------|------------------------------------|
| <i>i</i> | The value to assign to the object. |
|----------|------------------------------------|

#### Returns

A reference to the object being assigned to.

### 16.125.3.4 ParseFd()

```
virtual int MQTT::mqtt_bool::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

the data from a file descriptor according to this object's current default serialization method and assign the value.

#### Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

#### Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

### 16.125.3.5 RenderToBuffer()

```
virtual int MQTT::mqtt_bool::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

#### Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

#### Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

### 16.125.3.6 RenderToFd()

```
virtual int MQTT::mqtt_bool::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

## Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.125.3.7 SubscribeEvent()**

```
virtual int MQTT::mqtt_bool::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.125.3.8 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_bool::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

**16.126 MQTT::mqtt\_float Class Reference**

Easy MqttObj class for automatically publishing and subscribing floating point values to/from an [MQTT](#) topic. Use like a normal double.

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

## Public Member Functions

- [mqtt\\_float](#) (double val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=(eObj\_Flag\_PubOnWrite|eObj\_Flag\_Subscribe|eObj\_Flag\_Sub\_NoLocal))  
*Constructor for a standalone [mqtt\\_float](#) object.*

*Behavioral flags.*

## 16.126.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing floating point values to/from an [MQTT](#) topic. Use like a normal double.

## 16.126.2 Constructor & Destructor Documentation

### 16.126.2.1 mqtt\_float() [1/4]

```
MQTT::mqtt_float::mqtt_float (
 double val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_float](#) object.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>      | Initial value for the float                                                                                                        |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

### 16.126.2.2 mqtt\_float() [2/4]

```
MQTT::mqtt_float::mqtt_float (
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_float](#) object.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |

|              |                                               |
|--------------|-----------------------------------------------|
| <i>flags</i> | Behavioral flags to set on the created object |
|--------------|-----------------------------------------------|

### 16.126.2.3 mqtt\_float() [3/4]

```
MQTT::mqtt_float::mqtt_float (
 mqtt_leaf & parent,
 double val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_float](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the float                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

### 16.126.2.4 mqtt\_float() [4/4]

```
MQTT::mqtt_float::mqtt_float (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_float](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.126.3 Member Function Documentation

### 16.126.3.1 operator double()

```
MQTT::mqtt_float::operator double () const [inline]
```

Double precision floating point conversion operator for [mqtt\\_uint](#). Returns the value of the object as double.

#### Returns

The value of the object

### 16.126.3.2 operator=()

```
mqtt_float & MQTT::mqtt_float::operator= (
 double f)
```

Assignment operator for [mqtt\\_float](#). Assigns the value to the object, then performs any post assignment operations.

## Parameters

|          |                                    |
|----------|------------------------------------|
| <i>f</i> | The value to assign to the object. |
|----------|------------------------------------|

## Returns

A reference to the object being assigned to.

**16.126.3.3 ParseFd()**

```
virtual int MQTT::mqtt_float::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

the data from a file descriptor according to this object's current default serialization method and assign the value.

## Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

## Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

**16.126.3.4 RenderToBuffer()**

```
virtual int MQTT::mqtt_float::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

## Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.126.3.5 RenderToFd()**

```
virtual int MQTT::mqtt_float::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

## Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

### 16.126.3.6 SetStringFormat()

```
void MQTT::mqtt_float::SetStringFormat (
 char formatChar,
 uint8_t precision) [inline]
```

the printf style format char to use when serializing this object in a string form.

#### Parameters

|                   |                                      |
|-------------------|--------------------------------------|
| <i>formatChar</i> | The format character to use          |
| <i>precision</i>  | The precision to use when formatting |

### 16.126.3.7 SubscribeEvent()

```
virtual int MQTT::mqtt_float::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

#### Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

#### Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

### 16.126.3.8 TestOrSetValue()

```
virtual ValueTestResult MQTT::mqtt_float::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

#### Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

#### Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

## 16.127 MQTT::mqtt\_int Class Reference

Easy MqttObj class for automatically publishing and subscribing unsigned integer values to/from an [MQTT](#) topic. Use like a normal int32\_t.

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

## Public Member Functions

## 16.127.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing unsigned integer values to/from an [MQTT](#) topic. Use like a normal int32\_t.

## 16.127.2 Constructor & Destructor Documentation

### 16.127.2.1 mqtt\_int() [1/4]

```
MQTT::mqtt_int::mqtt_int (
 int val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_int](#) object.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>      | Initial value for the integer                                                                                                      |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

### 16.127.2.2 mqtt\_int() [2/4]

```
MQTT::mqtt_int::mqtt_int (
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_int](#) object.

## Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

**16.127.2.3 mqtt\_int() [3/4]**

```
MQTT::mqtt_int::mqtt_int (
 mqtt_leaf & parent,
 int val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_int](#) object.

## Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the integer                                                                                                      |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

**16.127.2.4 mqtt\_int() [4/4]**

```
MQTT::mqtt_int::mqtt_int (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_int](#) object.

## Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

**16.127.3 Member Function Documentation****16.127.3.1 operator int()**

```
MQTT::mqtt_int::operator int () const [inline]
```

Integer conversion operator for [mqtt\\_int](#). Returns the value of the object as an int.

## Returns

The integer value of the object

**16.127.3.2 operator++()** [1/2]

`mqtt_int & MQTT::mqtt_int::operator++ () [inline]`  
 Preincrement the object.

**Returns**

Reference to the object

**16.127.3.3 operator++()** [2/2]

`int32_t MQTT::mqtt_int::operator++ (int ) [inline]`  
 Postincrement the object.

**Returns**

The integer value before being incremented

**16.127.3.4 operator--()** [1/2]

`mqtt_int & MQTT::mqtt_int::operator-- () [inline]`  
 Predecrement the object.

**Returns**

Reference to the object

**16.127.3.5 operator--()** [2/2]

`int32_t MQTT::mqtt_int::operator-- (int ) [inline]`  
 Postdecrement the object.

**Returns**

The integer value before being decremented

**16.127.3.6 operator=()**

`mqtt_int & MQTT::mqtt_int::operator= (int i)`

Assignment operator for `mqtt_int`. Assigns the value to the object, then performs any post assignment operations.

**Parameters**

|          |                                    |
|----------|------------------------------------|
| <i>i</i> | The value to assign to the object. |
|----------|------------------------------------|

**Returns**

A reference to the object being assigned to.

**16.127.3.7 ParseFd()**

`virtual int MQTT::mqtt_int::ParseFd (int mqttFd) [override], [protected], [virtual]`

the data from a file descriptor according to this object's current default serialization method and assign the value.

## Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

## Returns

`eResult_t` return code

Implements [MQTT::mqtt\\_leaf](#).

**16.127.3.8 RenderToBuffer()**

```
virtual int MQTT::mqtt_int::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

## Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.127.3.9 RenderToFd()**

```
virtual int MQTT::mqtt_int::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

## Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.127.3.10 SubscribeEvent()**

```
virtual int MQTT::mqtt_int::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

## 16.127.3.11 TestOrSetValue()

```
virtual ValueTestResult MQTT::mqtt_int::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

## 16.128 MQTT::mqtt\_IO Class Reference

Easy MqttObj class for automatically publishing and subscribing hardware GPIO pins to/from an [MQTT](#) topic. Use like a normal [PinIO](#).

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

Inherited by [MQTT::mqtt\\_IO\\_Input](#), and [MQTT::mqtt\\_IO\\_Output](#).

## Public Member Functions

### 16.128.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing hardware GPIO pins to/from an [MQTT](#) topic. Use like a normal [PinIO](#).

### 16.128.2 Constructor & Destructor Documentation

#### 16.128.2.1 mqtt\_IO() [1/2]

```
MQTT::mqtt_IO::mqtt_IO (
 PinIO ioPin,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_IO](#) object.

##### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>ioPin</i>    | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

#### 16.128.2.2 mqtt\_IO() [2/2]

```
MQTT::mqtt_IO::mqtt_IO (
 mqtt_leaf & parent,
 PinIO ioPin,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_IO](#) object that has a parent.

##### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>ioPin</i>       | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.128.3 Member Function Documentation

### 16.128.3.1 ClearFlags()

```
virtual void MQTT::mqtt_IO::ClearFlags (
 uint16_t delFlags) [override], [virtual]
```

behavioral flags from this object

#### Parameters

|                 |                                          |
|-----------------|------------------------------------------|
| <i>delFlags</i> | The flags to be cleared from this object |
|-----------------|------------------------------------------|

Reimplemented from [MQTT::mqtt\\_leaf](#).

### 16.128.3.2 operator bool()

```
MQTT::mqtt_IO::operator bool () [inline]
```

Boolean conversion operator for [mqtt\\_IO](#). Returns the current state of the underlying GPIO.

#### Returns

The state of the underlying GPIO

### 16.128.3.3 operator"!()

```
bool MQTT::mqtt_IO::operator! () [inline]
```

Boolean Not operator for [mqtt\\_IO](#). Returns the negation of the current state of the underlying GPIO.

#### Returns

The negation of the current state of the underlying GPIO

### 16.128.3.4 operator=()

```
mqtt_IO & MQTT::mqtt_IO::operator= (
 bool val)
```

Assignment operator for [mqtt\\_IO](#). Assigns the value to the hardware GPIO, then performs any post assignment operations.

#### Parameters

|            |                                 |
|------------|---------------------------------|
| <i>val</i> | The value to assign to the pin. |
|------------|---------------------------------|

#### Returns

A reference to the object being assigned to.

### 16.128.3.5 ParseFd()

```
virtual int MQTT::mqtt_IO::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

the data from a file descriptor according to this object's current default serialization method and assign the value.

#### Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

#### Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

### 16.128.3.6 PinNotify()

```
static void MQTT::mqtt_IO::PinNotify (
 int port_num,
 int pin,
 void * ctx) [static]
```

Static notification function for pin state changes.

#### Parameters

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>port_num</i> | The GPIO port number that triggered this call.          |
| <i>pin</i>      | The GPIO pin index of the pin that triggered this call. |
| <i>ctx</i>      | The notification context associated with this call.     |

### 16.128.3.7 RenderToBuffer()

```
virtual int MQTT::mqtt_IO::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

#### Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

#### Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

### 16.128.3.8 RenderToFd()

```
virtual int MQTT::mqtt_IO::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

#### Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

#### Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

### 16.128.3.9 SetFixedDirection()

```
int MQTT::mqtt_IO::SetFixedDirection (
 int direction)
```

Set a fixed direction for the GPIO pin.

## Parameters

|                  |                                                           |
|------------------|-----------------------------------------------------------|
| <i>direction</i> | The direction to point: <0: input, 0: unfixed, >0: output |
|------------------|-----------------------------------------------------------|

## Returns

The direction the GPIO is fixed to: <0: input, 0: unfixed, >0: output

**16.128.3.10 SetFlags()**

```
virtual void MQTT::mqtt_IO::SetFlags (
 uint16_t newFlags) [override], [virtual]
```

additional behavioral flags for this object

## Parameters

|                 |                                |
|-----------------|--------------------------------|
| <i>newFlags</i> | The set of new flags to be set |
|-----------------|--------------------------------|

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.128.3.11 SubscribeEvent()**

```
virtual int MQTT::mqtt_IO::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.128.3.12 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_IO::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

## 16.129 MQTT::mqtt\_IO\_Input Class Reference

MqttObj connecting hardware GPIO pins to an Mqtt Broker. This class defaults the pin to an Input state.

#include <mqtt.h>

Inherits [MQTT::mqtt\\_IO](#).

### Public Member Functions

- [mqtt\\_IO\\_Input](#) (PinIO ioPin, const char \*topic, [Client](#) \*client=NULL, uint16\_t flags=0)

### 16.129.1 Detailed Description

MqttObj connecting hardware GPIO pins to an Mqtt Broker. This class defaults the pin to an Input state.

### 16.129.2 Constructor & Destructor Documentation

#### 16.129.2.1 mqtt\_IO\_Input() [1/2]

```
MQTT::mqtt_IO_Input::mqtt_IO_Input (
 PinIO ioPin,
 const char * topic,
 Client * client = NULL,
 uint16_t flags = 0) [inline]
```

Constructor for a standalone [mqtt\\_IO\\_Input](#) object.

## Parameters

|                |                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>ioPin</i>   | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>  | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>   | Behavioral flags to set on the created object                                                                                      |

## 16.129.2.2 mqtt\_IO\_Input() [2/2]

```
MQTT::mqtt_IO_Input::mqtt_IO_Input (
 mqtt_leaf & parent,
 PinIO ioPin,
 const char * topic,
 Client * client = NULL,
 uint16_t flags = 0) [inline]
```

Constructor for a [mqtt\\_IO\\_Input](#) object that has a parent.

## Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>ioPin</i>       | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i>     | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.129.3 Member Function Documentation

## 16.129.3.1 operator=()

```
mqtt_IO & MQTT::mqtt_IO::operator= (
 bool val)
```

Assignment operator for [mqtt\\_IO](#). Assigns the value to the hardware GPIO, then performs any post assignment operations.

## Parameters

|            |                                 |
|------------|---------------------------------|
| <i>val</i> | The value to assign to the pin. |
|------------|---------------------------------|

## Returns

A reference to the object being assigned to.

The documentation for this class was generated from the following file:

- mqtt.h

## 16.130 MQTT::mqtt\_IO\_Output Class Reference

MqttObj connecting hardware GPIO pins to an Mqtt Broker. This class defaults the pin to an Output state.

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_IO](#).

## Public Member Functions

- `mqtt_IO_Output` (`PinIO` ioPin, `const char *`topic, `Client *`client=NULL, `uint16_t` flags=0)  
*Constructor for a standalone `mqtt_IO_Output` object.*
- `mqtt_IO_Output` (`mqtt_Leaf` &parent, `PinIO` ioPin, `const char *`topic, `Client *`client=NULL, `uint16_t` flags=0)  
*Constructor for a `mqtt_IO_Output` object that has a parent.*
- `mqtt_IO` & `operator=` (`bool` val)  
*Assignment operator for `mqtt_IO`. Assigns the value to the hardware GPIO, then performs any post assignment operations.*

## Public Member Functions inherited from `MQTT::mqtt_IO`

- `mqtt_IO` (`PinIO` ioPin, `const char *`topic, `Client *`mClient=NULL, `uint16_t` flags=(`eObj_Flag_PubOnWrite`|`eObj_Flag_Subscribe`))  
*Constructor for a standalone `mqtt_IO` object.*
- `mqtt_IO` (`mqtt_Leaf` &parent, `PinIO` ioPin, `const char *`topic, `Client *`mClient=NULL, `uint16_t` flags=(`eObj_Flag_PubOnWrite`|`eObj_Flag_Subscribe`))  
*Constructor for a `mqtt_IO` object that has a parent.*
- virtual `void` `SetFlags` (`uint16_t` newFlags) override  
*additional behavioral flags for this object*
- virtual `void` `ClearFlags` (`uint16_t` delFlags) override  
*behavioral flags from this object*
- `int` `SetFixedDirection` (`int` direction)  
*Set a fixed direction for the GPIO pin.*
- `mqtt_IO` & `operator=` (`bool` val)  
*Assignment operator for `mqtt_IO`. Assigns the value to the hardware GPIO, then performs any post assignment operations.*
- `operator bool` ()  
*Boolean conversion operator for `mqtt_IO`. Returns the current state of the underlying GPIO.*
- `bool` `operator!` ()  
*Boolean Not operator for `mqtt_IO`. Returns the negation of the current state of the underlying GPIO.*
- virtual `ValueTestResult` `TestOrSetValue` (`ParsedJsonDataSet` &pjs, `bool` setVal) override  
*whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.*
- virtual `int` `SubscribeEvent` (`int` mqttFd, `PacketInfo::Msg *`msg) override  
*Handle a message sent by the Broker triggered by this object's Subscription.*
- virtual `int` `RenderToBuffer` (`eObj_Serialize_t` form, `uint8_t *`buf, `int` buflen) override  
*Render this object to an output buffer.*
- virtual `int` `RenderToFd` (`eObj_Serialize_t` form, `int` fd) override  
*Render this object to an output socket.*

## Public Member Functions inherited from `MQTT::mqtt_Leaf`

- `~mqtt_Leaf` ()  
*~mqtt\_Leaf Destructor for base `mqtt_Leaf`*
- `void` `RemoveFromTree` ()  
*Remove this object from it's parent tree.*
- `bool` `NameMatch` (`const char *`cp)  
*Determine whether a given name matches this object.*
- virtual `int` `GetPubTopicName` (`NBString` &s)  
*Get the Topic Name this object Publishes to.*
- virtual `int` `GetSubTopicFilter` (`NBString` &s)  
*Get the Subscription Topic Filter this object Subscribes to.*
- virtual `int` `GetRenderLength` (`eObj_Serialize_t` form=`eObj_Serialize_CURRENT_FORM`)  
*Get the number of bytes used to serialize this object in a particular format.*

- int [Publish](#) (int waitForCompletion=-1)  
*Publishes the current [MQTT](#) object, optionally waiting for completion.*
- void [SetPublishInterval](#) (uint32\_t intervalPeriodTicks)  
*Sets or clears an automatic publishing interval for this [MQTT](#) object.*
- virtual void [SetSerializationForm](#) (eObj\_Serialize\_t form)  
*Set the default serialization format for this object.*
- [eObj\\_Serialize\\_t](#) [GetSerializationForm](#) ()  
*Get the default serialization format for this object.*
- uint16\_t [GetFlags](#) ()  
*Get the behavioral flags set for this object.*
- int [getPriority](#) ()  
*Get the message priority for this object.*

### Additional Inherited Members

### Public Types inherited from [MQTT::mqtt\\_leaf](#)

## 16.130.1 Detailed Description

MqttObj connecting hardware GPIO pins to an Mqtt Broker. This class defaults the pin to an Output state.

## 16.130.2 Constructor & Destructor Documentation

### 16.130.2.1 mqtt\_IO\_Output() [1/2]

```
MQTT::mqtt_IO_Output::mqtt_IO_Output (
 PinIO ioPin,
 const char * topic,
 Client * client = NULL,
 uint16_t flags = 0) [inline]
```

Constructor for a standalone [mqtt\\_IO\\_Output](#) object.

#### Parameters

|                |                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>ioPin</i>   | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>  | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>   | Behavioral flags to set on the created object                                                                                      |

### 16.130.2.2 mqtt\_IO\_Output() [2/2]

```
MQTT::mqtt_IO_Output::mqtt_IO_Output (
 mqtt_leaf & parent,
 PinIO ioPin,
 const char * topic,
 Client * client = NULL,
 uint16_t flags = 0) [inline]
```

Constructor for a [mqtt\\_IO\\_Output](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>ioPin</i>       | GPIO pin to control/report                                                                                                         |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i>     | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.130.3 Member Function Documentation

### 16.130.3.1 operator=()

```
mqtt_IO & MQTT::mqtt_IO::operator= (
 bool val)
```

Assignment operator for [mqtt\\_IO](#). Assigns the value to the hardware GPIO, then performs any post assignment operations.

#### Parameters

|            |                                 |
|------------|---------------------------------|
| <i>val</i> | The value to assign to the pin. |
|------------|---------------------------------|

#### Returns

A reference to the object being assigned to.

The documentation for this class was generated from the following file:

- [mqtt.h](#)

## 16.131 MQTT::mqtt\_leaf Class Reference

Base class for all Mqtt Objects (MqttObj). Mqtt Objects provide a seamless bridge/synchronization to communicate information through an [MQTT](#) Broker via a [Client](#) object.

#include <mqtt.h>

Inherits [TimeOutElement](#).

Inherited by [MQTT::ConfigExposer](#), [MQTT::SubHandler](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), and [MQTT::mqtt\\_uint](#).

#### Public Types

- enum [eObj\\_State\\_t](#)  
*Mqtt Object Publication/Subscription States.*

## Public Member Functions

- `~mqtt_leaf ()`  
*~mqtt\_leaf Destructor for base [mqtt\\_leaf](#)*
- `void RemoveFromTree ()`  
*Remove this object from it's parent tree.*
- `bool NameMatch (const char *cp)`  
*Determine whether a given name matches this object.*
- `virtual ValueTestResult TestOrSetValue (ParsedJsonDataSet &pjs, bool setVal)=0`  
*Test whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.*
- `virtual int GetPubTopicName (NBString &s)`  
*Get the Topic Name this object Publishes to.*
- `virtual int GetSubTopicFilter (NBString &s)`  
*Get the Subscription Topic Filter this object Subscribes to.*
- `virtual int SubscribeEvent (int mqttFd, PacketInfo::Msg *msg)`  
*Handle a message sent by the Broker triggered by this object's Subscription.*
- `virtual int GetRenderLength (eObj_Serialize_t form=eObj_Serialize_CURRENT_FORM)`  
*Get the number of bytes used to serialize this object in a particular format.*
- `int Publish (int waitForCompletion=-1)`  
*Publishes the current [MQTT](#) object, optionally waiting for completion.*
- `void SetPublishInterval (uint32_t intervalPeriodTicks)`  
*Sets or clears an automatic publishing interval for this [MQTT](#) object.*
- `virtual void SetSerializationForm (eObj_Serialize_t form)`  
*Set the default serialization format for this object.*
- `eObj_Serialize_t GetSerializationForm ()`  
*Get the default serialization format for this object.*

### 16.131.1 Detailed Description

Base class for all Mqtt Objects (MqttObj). Mqtt Objects provide a seamless bridge/synchronization to communicate information through an MQTT Broker via a [Client](#) object.

## 16.131.2 Constructor & Destructor Documentation

### 16.131.2.1 mqtt\_leaf() [1/2]

```
MQTT::mqtt_leaf::mqtt_leaf (
 const char * topic,
 Client * mClient,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

[protected]

Constructor for [mqtt\\_leaf](#) objects.

#### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

### 16.131.2.2 mqtt\_leaf() [2/2]

```
MQTT::mqtt_leaf::mqtt_leaf (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

[protected]

Constructor for [mqtt\\_leaf](#) objects.

#### Parameters

|                    |                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent object.                                                                                                                   |
| <i>*topic</i>      | Additional Topic Name for the leaf, added as another level in the topic path after the parent objects topic (parent='/foo', this='/foo/bar'). |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> .            |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                                 |

## 16.131.3 Member Function Documentation

### 16.131.3.1 AddChild()

```
virtual mqtt_leaf * MQTT::mqtt_leaf::AddChild (
 mqtt_leaf * child) [protected], [virtual]
```

Add an MqttObj as a child to this object.

#### Parameters

|               |                                    |
|---------------|------------------------------------|
| <i>*child</i> | Pointer to the child object to add |
|---------------|------------------------------------|

#### Returns

Pointer to the first child of this object

Reimplemented in [MQTT::mqtt\\_obj](#).

**16.131.3.2 Assign()**

```
int MQTT::mqtt_leaf::Assign () [protected]
```

Perform post assignment operations.

**Returns**

eResult\_t return code

**16.131.3.3 ClearFlags()**

```
virtual void MQTT::mqtt_leaf::ClearFlags (
 uint16_t delFlags) [virtual]
```

Clear behavioral flags from this object.

**Parameters**

|                 |                                          |
|-----------------|------------------------------------------|
| <i>delFlags</i> | The flags to be cleared from this object |
|-----------------|------------------------------------------|

Reimplemented in [MQTT::mqtt\\_IO](#).

**16.131.3.4 ForEachLeaf()**

```
void MQTT::mqtt_leaf::ForEachLeaf (
 LeafCallBack * p,
 void * pd) [protected]
```

Call a function on each element of the MqttObj tree with this object as the root.

**Parameters**

|            |                                                                    |
|------------|--------------------------------------------------------------------|
| <i>*p</i>  | Pointer to the function to be executed on each element of the tree |
| <i>*pd</i> | Pointer to extra data to pass to the function being called         |

**16.131.3.5 GetChildren()**

```
virtual mqtt_leaf * MQTT::mqtt_leaf::GetChildren () [protected], [virtual]
```

Get the first child of this object.

**Returns**

Pointer to the first child of this object

Reimplemented in [MQTT::mqtt\\_obj](#).

**16.131.3.6 GetFlags()**

```
uint16_t MQTT::mqtt_leaf::GetFlags () [inline]
```

Get the behavioral flags set for this object.

**Returns**

The flags to set for this object

**16.131.3.7 getPriority()**

```
int MQTT::mqtt_leaf::getPriority () [inline]
```

Get the message priority for this object.

**Returns**

The message priority for this object.

**16.131.3.8 GetPubTopicName()**

```
virtual int MQTT::mqtt_leaf::GetPubTopicName (
 NBString & s) [virtual]
```

Get the Topic Name this object Publishes to.

**Parameters**

|               |                                                          |
|---------------|----------------------------------------------------------|
| <b>&amp;s</b> | The <a href="#">NBString</a> to copy the Topic Name into |
|---------------|----------------------------------------------------------|

**Returns**

eResult\_t return code

Reimplemented in [MQTT::ConfigExposer](#).

**16.131.3.9 GetRenderLength()**

```
virtual int MQTT::mqtt_leaf::GetRenderLength (
 eObj_Serialize_t form = eObj_Serialize_CURRENT_FORM) [virtual]
```

Get the number of bytes used to serialize this object in a particular format.

**Parameters**

|             |                             |
|-------------|-----------------------------|
| <b>form</b> | Serialization format to use |
|-------------|-----------------------------|

**Returns**

Length of serialized data

Reimplemented in [MQTT::ConfigExposer](#), and [MQTT::mqtt\\_obj](#).

**16.131.3.10 GetSerializationForm()**

```
eObj_Serialize_t MQTT::mqtt_leaf::GetSerializationForm () [inline]
```

Get the default serialization format for this object.

**Returns**

eObj\_Serialize\_t Serialization format in use

**16.131.3.11 GetSubTopicFilter()**

```
virtual int MQTT::mqtt_leaf::GetSubTopicFilter (
 NBString & s) [virtual]
```

Get the Subscription Topic Filter this object Subscribes to.

**Parameters**

|               |                                                                         |
|---------------|-------------------------------------------------------------------------|
| <b>&amp;s</b> | The <a href="#">NBString</a> to copy the Subscription Topic Filter into |
|---------------|-------------------------------------------------------------------------|

**Returns**

eResult\_t return code

Reimplemented in [MQTT::ConfigExposer](#), and [MQTT::mqtt\\_obj](#).

**16.131.3.12 HandlePubAck()**

```
int MQTT::mqtt_leaf::HandlePubAck (
 int mqttFd,
 PacketInfo::Msg * msg) [protected]
```

Handle an Publish Acknowledge message from the broker for our Publish request.

## Parameters

|               |                                                                  |
|---------------|------------------------------------------------------------------|
| <i>mqttFd</i> | File descriptor to read additional message data from             |
| <i>*msg</i>   | Pointer to message struct containing the Publish Acknowledgement |

## Returns

eResult\_t return code

**16.131.3.13 HandleSubAck()**

```
int MQTT::mqtt_leaf::HandleSubAck (
 int mqttFd,
 PacketInfo::Msg * msg) [protected]
```

Handle a Subscribe Acknowledge message from the broker for our Subscribe request.

## Parameters

|               |                                                                    |
|---------------|--------------------------------------------------------------------|
| <i>mqttFd</i> | File descriptor to read additional message data from               |
| <i>*msg</i>   | Pointer to message struct containing the Subscribe Acknowledgement |

## Returns

eResult\_t return code

**16.131.3.14 HandleUnsubAck()**

```
int MQTT::mqtt_leaf::HandleUnsubAck (
 int mqttFd,
 PacketInfo::Msg * msg) [protected]
```

Handle an Unsubscribe Acknowledge message from the broker for our Unsubscribe request.

## Parameters

|               |                                                                      |
|---------------|----------------------------------------------------------------------|
| <i>mqttFd</i> | File descriptor to read additional message data from                 |
| <i>*msg</i>   | Pointer to message struct containing the Unsubscribe Acknowledgement |

## Returns

eResult\_t return code

**16.131.3.15 MatchId()**

```
bool MQTT::mqtt_leaf::MatchId (
 ParsedJsonDataSet & pjs) [protected]
```

Determine whether the JSON dataset's current index matches this object's name.

## Parameters

|                 |                                                   |
|-----------------|---------------------------------------------------|
| <i>&amp;pjs</i> | Reference to the JSON dataset to be assigned from |
|-----------------|---------------------------------------------------|

## Returns

Whether the JSON dataset's current index matches this object's name.

**16.131.3.16 MqttRxPublish()**

```
static int MQTT::mqtt_leaf::MqttRxPublish (
 Client * mClient,
 int mqttFd,
 PacketInfo::Msg * msg,
 void * ctx) [static]
```

Static message handler for Publish messages received by the registered [Client](#).

**Parameters**

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <i>*mClient</i> | Pointer to the <a href="#">Client</a> that received the message |
| <i>mqttFd</i>   | File Descriptor to read any additional data from                |
| <i>*msg</i>     | Pointer to the structure containing the received message        |
| <i>*ctx</i>     | Pointer to the leaf this message is for                         |

**Returns**

The message priority for this object.

**16.131.3.17 NameMatch()**

```
bool MQTT::mqtt_leaf::NameMatch (
 const char * cp)
```

Determine whether a given name matches this object.

**Parameters**

|            |                       |
|------------|-----------------------|
| <i>*cp</i> | Name to check against |
|------------|-----------------------|

**Returns**

Whether the given name matches this object

**16.131.3.18 ParseFd()**

```
virtual int MQTT::mqtt_leaf::ParseFd (
 int mqttFd) [protected], [pure virtual]
```

Parse the data from a file descriptor according to this object's current default serialization method and assign the value.

**Parameters**

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

**Returns**

eResult\_t return code

Implemented in [MQTT::ConfigExposer](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), [MQTT::mqtt\\_uint](#), and [MQTT::SubHandler](#).

**16.131.3.19 Publish()**

```
int MQTT::mqtt_leaf::Publish (
 int waitForCompletion = -1)
```

Publishes the current [MQTT](#) object, optionally waiting for completion.

This method queues the object for publication via [MQTT](#). If `waitForCompletion` is greater than 0, or if the object is configured to wait (`eObj_Flag_WaitForPub`), the function will block until the publish operation is complete.

## Parameters

|                          |                                              |
|--------------------------|----------------------------------------------|
| <i>waitForCompletion</i> | Set to 1 to block until the publish is done. |
|--------------------------|----------------------------------------------|

## Returns

eResult\_Success on successful queuing and (if applicable) completion; error codes may propagate from [QueuePublish\(\)](#).

## See also

[QueuePublish](#)

**16.131.3.20 PubState()**

```
uint8_t MQTT::mqtt_leaf::PubState () [inline], [protected]
```

Get the Publish state.

## Returns

eObj\_State\_t state of this object

**16.131.3.21 QueuePublish()**

```
int MQTT::mqtt_leaf::QueuePublish () [protected]
```

Queue this object to be Published via the registered [Client](#).

## Returns

eResult\_t return code

## See also

[Client::Publish](#)

**16.131.3.22 QueueSubscribe()**

```
int MQTT::mqtt_leaf::QueueSubscribe () [protected]
```

Queue this object to be Subscribed via the registered [Client](#).

## Returns

eResult\_t return code

## See also

[Client::Subscribe](#)

**16.131.3.23 QueueUnsubscribe()**

```
int MQTT::mqtt_leaf::QueueUnsubscribe () [protected]
```

Queue this object to be Unsubscribed via the registered [Client](#).

## Returns

eResult\_t return code

## See also

[Client::Unsubscribe](#)

**16.131.3.24 RemoveFirstChild()**

```
virtual mqtt_leaf * MQTT::mqtt_leaf::RemoveFirstChild () [protected], [virtual]
```

Remove the first child from this object.

**Returns**

Pointer to the new first child of this object

Reimplemented in [MQTT::mqtt\\_obj](#).

**16.131.3.25 RenderToBuffer()**

```
virtual int MQTT::mqtt_leaf::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [pure virtual]
```

Render this object to an output buffer.

**Parameters**

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

**Returns**

Length of the rendered data

Implemented in [MQTT::ConfigExposer](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), [MQTT::mqtt\\_uint](#), and [MQTT::SubHandler](#).

**16.131.3.26 RenderToFd()**

```
virtual int MQTT::mqtt_leaf::RenderToFd (
 eObj_Serialize_t form,
 int fd) [pure virtual]
```

Render this object to an output socket.

**Parameters**

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

**Returns**

Length of the rendered data

Implemented in [MQTT::ConfigExposer](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), [MQTT::mqtt\\_uint](#), and [MQTT::SubHandler](#).

**16.131.3.27 RootParse()**

```
void MQTT::mqtt_leaf::RootParse (
 ParsedJsonDataSet & pjs) [protected]
```

Assign to this object tree from a JSON dataset.

**Parameters**

|                 |                                                   |
|-----------------|---------------------------------------------------|
| <i>&amp;pjs</i> | Reference to the JSON dataset to be assigned from |
|-----------------|---------------------------------------------------|

**16.131.3.28 SetFlags()**

```
virtual void MQTT::mqtt_leaf::SetFlags (
 uint16_t newFlags) [virtual]
```

Set additional behavioral flags for this object.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <i>newFlags</i> | The set of new flags to be set |
|-----------------|--------------------------------|

Reimplemented in [MQTT::mqtt\\_IO](#).

**16.131.3.29 SetPublishInterval()**

```
void MQTT::mqtt_leaf::SetPublishInterval (
 uint32_t intervalPeriodTicks)
```

Sets or clears an automatic publishing interval for this [MQTT](#) object.

If a non-zero interval is specified, the object will be automatically published at the given interval (in system ticks). If the interval is zero, the automatic publishing is disabled by deregistering the object from the client's scheduler.

**Parameters**

|                            |                                                                                    |
|----------------------------|------------------------------------------------------------------------------------|
| <i>intervalPeriodTicks</i> | The interval period in system ticks. A value of zero disables periodic publishing. |
|----------------------------|------------------------------------------------------------------------------------|

**Note**

This operation has no effect if the [MQTT](#) client (`mClient`) is not initialized.

**16.131.3.30 SetPubState()**

```
virtual void MQTT::mqtt_leaf::SetPubState (
 uint8_t newState) [protected], [virtual]
```

Set the Publish state.

**Parameters**

|                 |                                       |
|-----------------|---------------------------------------|
| <i>newState</i> | The new Publish state for this object |
|-----------------|---------------------------------------|

Reimplemented in [MQTT::mqtt\\_obj](#).

**16.131.3.31 SetSerializationForm()**

```
virtual void MQTT::mqtt_leaf::SetSerializationForm (
 eObj_Serialize_t form) [virtual]
```

Set the default serialization format for this object.

**Parameters**

|             |                             |
|-------------|-----------------------------|
| <i>form</i> | Serialization format to use |
|-------------|-----------------------------|

**16.131.3.32 SetSubState()**

```
virtual void MQTT::mqtt_leaf::SetSubState (
 uint8_t newState) [protected], [virtual]
```

Set the Subscribe state.

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>newState</i> | The new Subscribe state for this object |
|-----------------|-----------------------------------------|

Reimplemented in [MQTT::mqtt\\_obj](#).

**16.131.3.33 SubscribeEvent()**

```
virtual int MQTT::mqtt_leaf::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented in [MQTT::ConfigExposer](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), [MQTT::mqtt\\_uint](#), and [MQTT::SubHandler](#).

**16.131.3.34 SubState()**

```
uint8_t MQTT::mqtt_leaf::SubState () [inline], [protected]
```

Get the Subscribe state of this object.

## Returns

eObj\_State\_t state

**16.131.3.35 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_leaf::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [pure virtual]
```

Test whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implemented in [MQTT::ConfigExposer](#), [MQTT::mqtt\\_bool](#), [MQTT::mqtt\\_float](#), [MQTT::mqtt\\_int](#), [MQTT::mqtt\\_IO](#), [MQTT::mqtt\\_obj](#), [MQTT::mqtt\\_string](#), [MQTT::mqtt\\_uint](#), and [MQTT::SubHandler](#).

The documentation for this class was generated from the following file:

- [mqtt.h](#)

## 16.132 MQTT::mqtt\_obj Class Reference

Base class for easy [MQTT](#) Objects ([MqttObj](#)). [mqtt\\_obj](#) are comprised of higher order parent objects that contain registered child objects.

#include <mqtt.h>

Inherits [MQTT::mqtt\\_leaf](#).

Inherited by [ControlSet](#), [PIDSet](#), and [TempRange](#).

### Public Member Functions

- virtual [ValueTestResult](#) [TestOrSetValue](#) ([ParsedJsonDataSet](#) &pjs, bool setVal) override  
*whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.*
- virtual int [RenderToBuffer](#) ([eObj\\_Serialize\\_t](#) form, uint8\_t \*buf, int buflen) override  
*Render this object to an output buffer.*
- virtual int [RenderToFd](#) ([eObj\\_Serialize\\_t](#) form, int fd) override  
*Render this object to an output socket.*

*Default serialization form.*
- [uint16\\_t](#) **mFlags**  
*Behavioral flags.*

### 16.132.1 Detailed Description

Base class for easy MQTT Objects (MqttObj). [mqtt\\_obj](#) are comprised of higher order parent objects that contain registered child objects.

### 16.132.2 Constructor & Destructor Documentation

#### 16.132.2.1 mqtt\_obj() [1/2]

```
MQTT::mqtt_obj::mqtt_obj (
 const char * topic,
 Client * mClient,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

[protected]

Constructor for a standalone [mqtt\\_obj](#) object.

##### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

#### 16.132.2.2 mqtt\_obj() [2/2]

```
MQTT::mqtt_obj::mqtt_obj (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

[protected]

Constructor for an [mqtt\\_obj](#) with a known parent object.

##### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <i>&amp;parent</i> | Reference to parent object. |
|--------------------|-----------------------------|

## Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

**16.132.3 Member Function Documentation****16.132.3.1 AddChild()**

virtual [mqtt\\_leaf](#) \* MQTT::mqtt\_obj::AddChild (   
                   [mqtt\\_leaf](#) \* child) [override], [protected], [virtual]   
 an MqttObj as a child to this object.

## Parameters

|               |                                    |
|---------------|------------------------------------|
| <i>*child</i> | Pointer to the child object to add |
|---------------|------------------------------------|

## Returns

Pointer to the first child of this object

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.2 FindChild()**

[mqtt\\_leaf](#) \* MQTT::mqtt\_obj::FindChild (   
                   const char \* topic) [protected]   
 the child object that is registered for the given Topic Name.

## Parameters

|               |                                      |
|---------------|--------------------------------------|
| <i>*topic</i> | The Topic Name to find the child for |
|---------------|--------------------------------------|

## Returns

Pointer to the child that matches the given Topic Name

**16.132.3.3 GetChildren()**

virtual [mqtt\\_leaf](#) \* MQTT::mqtt\_obj::GetChildren () [override], [protected], [virtual]   
 the first child of this object.

## Returns

Pointer to the first child of this object

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.4 GetRenderLength()**

virtual int MQTT::mqtt\_obj::GetRenderLength (   
                   eObj\_Serialize\_t form = eObj\_Serialize\_CURRENT\_FORM) [override], [protected],   
 [virtual]   
 the number of bytes used to serialize this object in a particular format.

## Parameters

|             |                             |
|-------------|-----------------------------|
| <i>form</i> | Serialization format to use |
|-------------|-----------------------------|

## Returns

Length of serialized data

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.5 GetSubTopicFilter()**

```
virtual int MQTT::mqtt_obj::GetSubTopicFilter (
 NBString & s) [override], [protected], [virtual]
```

the Subscription Topic Filter this object Subscribes to.

## Parameters

|    |                                                                         |
|----|-------------------------------------------------------------------------|
| &s | The <a href="#">NBString</a> to copy the Subscription Topic Filter into |
|----|-------------------------------------------------------------------------|

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.6 ParseFd()**

```
virtual int MQTT::mqtt_obj::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

the data from a file descriptor according to this object's current default serialization method and assign the value.

## Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

## Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

**16.132.3.7 RemoveFirstChild()**

```
virtual mqtt_leaf * MQTT::mqtt_obj::RemoveFirstChild () [override], [protected], [virtual]
```

Remove the first child from this object.

## Returns

Pointer to the new first child of this object

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.8 RenderToBuffer()**

```
virtual int MQTT::mqtt_obj::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

**Parameters**

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

**Returns**

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.132.3.9 RenderToFd()**

```
virtual int MQTT::mqtt_obj::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

**Parameters**

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

**Returns**

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.132.3.10 SetPubState()**

```
virtual void MQTT::mqtt_obj::SetPubState (
 uint8_t newState) [override], [protected], [virtual]
```

the Publish state

**Parameters**

|                 |                                       |
|-----------------|---------------------------------------|
| <i>newState</i> | The new Publish state for this object |
|-----------------|---------------------------------------|

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.11 SetSubState()**

```
virtual void MQTT::mqtt_obj::SetSubState (
 uint8_t newState) [override], [protected], [virtual]
```

the Subscribe state

**Parameters**

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>newState</i> | The new Subscribe state for this object |
|-----------------|-----------------------------------------|

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.12 SubscribeEvent()**

```
virtual int MQTT::mqtt_obj::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [protected], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.132.3.13 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_obj::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

**16.133 MQTT::mqtt\_string Class Reference**

Easy MqttObj class for automatically publishing and subscribing string values to/from an [MQTT](#) topic. Use like a normal [NBString](#).

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

**Public Member Functions**

- [mqtt\\_string](#) (const char \*val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a standalone mqtt\_string object.*
- [mqtt\\_string](#) (const [NBString](#) &val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a standalone mqtt\_string object.*
- [mqtt\\_string](#) (const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a standalone mqtt\_string object.*
- [mqtt\\_string](#) ([mqtt\\_leaf](#) &parent, const char \*val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a mqtt\_string object that has a parent.*
- [mqtt\\_string](#) ([mqtt\\_leaf](#) &parent, const [NBString](#) &val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a mqtt\_string object that has a parent.*
- [mqtt\\_string](#) ([mqtt\\_leaf](#) &parent, const [NBString](#) &val, const char \*topic, [Client](#) \*mClient=NULL, uint16\_t flags=0)  
*Constructor for a mqtt\_string object that has a parent.*

*Constructor for a mqtt\_string object that has a parent.*
- [mqtt\\_string](#) & operator= (const [NBString](#) &s)

- Assignment operator for [mqtt\\_string](#). Assigns the value to the object, then performs any post assignment operations.
- [mqtt\\_string](#) & [operator=](#) (const char \*s)
  - Assignment operator for [mqtt\\_string](#). Assigns the value to the object, then performs any post assignment operations.
- [operator NBString](#) () const
  - [NBString](#) conversion operator for [mqtt\\_string](#). Returns the value of the object as an [NBString](#).
- const char [operator\[\]](#) (size\_t pos) const
  - operator that returns the const char value of the character at the index. Operates on const objects.
- char & [operator\[\]](#) (size\_t pos)
  - operator that returns a reference to the character at the given position.
- virtual ValueTestResult [TestOrSetValue](#) (ParsedJsonDataSet &pjs, bool setVal) override
  - Test whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.
- virtual int [SubscribeEvent](#) (int mqttFd, PacketInfo::Msg \*msg) override
  - Handle a message sent by the Broker triggered by this object's Subscription.
- virtual int [RenderToBuffer](#) (eObj\_Serialize\_t form, uint8\_t \*buf, int buflen) override
  - Render this object to an output buffer.
- virtual int [RenderToFd](#) (eObj\_Serialize\_t form, int fd) override
  - Render this object to an output socket.

## Public Member Functions inherited from MQTT::mqtt\_leaf

- ~[mqtt\\_leaf](#) ()
  - ~mqtt\_leaf Destructor for base [mqtt\\_leaf](#)
- void [RemoveFromTree](#) ()
  - Remove this object from it's parent tree.
- bool [NameMatch](#) (const char \*cp)
  - Determine whether a given name matches this object.
- virtual int [GetPubTopicName](#) (NBString &s)
  - Get the Topic Name this object Publishes to.
- virtual int [GetSubTopicFilter](#) (NBString &s)
  - Get the Subscription Topic Filter this object Subscribes to.
- virtual int [GetRenderLength](#) (eObj\_Serialize\_t form=eObj\_Serialize\_CURRENT\_FORM)
  - Get the number of bytes used to serialize this object in a particular format.
- int [Publish](#) (int waitForCompletion=-1)
  - Publishes the current [MQTT](#) object, optionally waiting for completion.
- void [SetPublishInterval](#) (uint32\_t intervalPeriodTicks)
  - Sets or clears an automatic publishing interval for this [MQTT](#) object.
- virtual void [SetSerializationForm](#) (eObj\_Serialize\_t form)
  - Set the default serialization format for this object.
- eObj\_Serialize\_t [GetSerializationForm](#) ()
  - Get the default serialization format for this object.
- virtual void [SetFlags](#) (uint16\_t newFlags)
  - Set additional behavioral flags for this object.
- virtual void [ClearFlags](#) (uint16\_t delFlags)
  - Clear behavioral flags from this object.
- uint16\_t [GetFlags](#) ()
  - Get the behavioral flags set for this object.
- int [getPriority](#) ()
  - Get the message priority for this object.

### Protected Member Functions

- virtual int [ParseFd](#) (int mqttFd) override  
*the data from a file descriptor according to this object's current default serialization method and assign the value.*

### 16.133.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing string values to/from an [MQTT](#) topic. Use like a normal [NBString](#).

### 16.133.2 Constructor & Destructor Documentation

#### 16.133.2.1 mqtt\_string() [1/6]

```
MQTT::mqtt_string::mqtt_string (
 const char * val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a standalone [mqtt\\_string](#) object.

##### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>      | Initial value for the string                                                                                                       |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

#### 16.133.2.2 mqtt\_string() [2/6]

```
MQTT::mqtt_string::mqtt_string (
 const NBString & val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a standalone [mqtt\\_string](#) object.

##### Parameters

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>      | Initial value for the string                                                                                                       |
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

**16.133.2.3 mqtt\_string() [3/6]**

```
MQTT::mqtt_string::mqtt_string (
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a standalone [mqtt\\_string](#) object.

**Parameters**

|                 |                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>   | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>    | Behavioral flags to set on the created object                                                                                      |

**16.133.2.4 mqtt\_string() [4/6]**

```
MQTT::mqtt_string::mqtt_string (
 mqtt_leaf & parent,
 const char * val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a [mqtt\\_string](#) object that has a parent.

**Parameters**

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the string                                                                                                       |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

**16.133.2.5 mqtt\_string() [5/6]**

```
MQTT::mqtt_string::mqtt_string (
 mqtt_leaf & parent,
 const NBString & val,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a [mqtt\\_string](#) object that has a parent.

**Parameters**

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the string                                                                                                       |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

### 16.133.2.6 mqtt\_string() [6/6]

```
MQTT::mqtt_string::mqtt_string (
 mqtt_leaf & parent,
 const char * topic,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

Constructor for a [mqtt\\_string](#) object that has a parent.

#### Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*mClient</i>    | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

## 16.133.3 Member Function Documentation

### 16.133.3.1 operator NBString()

```
MQTT::mqtt_string::operator NBString () const [inline]
```

[NBString](#) conversion operator for [mqtt\\_string](#). Returns the value of the object as an [NBString](#).

#### Returns

The [NBString](#) value of the object

### 16.133.3.2 operator=() [1/2]

```
mqtt_string & MQTT::mqtt_string::operator= (
 const char * s)
```

Assignment operator for [mqtt\\_string](#). Assigns the value to the object, then performs any post assignment operations.

#### Parameters

|          |                                    |
|----------|------------------------------------|
| <i>s</i> | The value to assign to the object. |
|----------|------------------------------------|

#### Returns

A reference to the object being assigned to.

### 16.133.3.3 operator=() [2/2]

```
mqtt_string & MQTT::mqtt_string::operator= (
 const NBString & s)
```

Assignment operator for [mqtt\\_string](#). Assigns the value to the object, then performs any post assignment operations.

#### Parameters

|          |                                    |
|----------|------------------------------------|
| <i>s</i> | The value to assign to the object. |
|----------|------------------------------------|

#### Returns

A reference to the object being assigned to.

**16.133.3.4 operator[]()** [1/2]

```
char & MQTT::mqtt_string::operator[] (
 size_t pos) [inline]
```

operator that returns a reference to the character at the given position.

**Returns**

Reference to the character at the given position

**16.133.3.5 operator[]()** [2/2]

```
const char MQTT::mqtt_string::operator[] (
 size_t pos) const [inline]
```

operator that returns the const char value of the character an the index. Operates on const objects.

**Returns**

The value of the characterat the position

**16.133.3.6 ParseFd()**

```
virtual int MQTT::mqtt_string::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

the data from a file descriptor according to this object's current default serialization method and assign the value.

**Parameters**

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

**Returns**

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

**16.133.3.7 RenderToBuffer()**

```
virtual int MQTT::mqtt_string::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

**Parameters**

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

**Returns**

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.133.3.8 RenderToFd()**

```
virtual int MQTT::mqtt_string::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

## Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.133.3.9 SubscribeEvent()**

```
virtual int MQTT::mqtt_string::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.133.3.10 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_string::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

Test whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

The documentation for this class was generated from the following file:

- mqtt.h

**16.134 MQTT::mqtt\_uint Class Reference**

Easy MqttObj class for automatically publishing and subscribing unsigned integer values to/from an [MQTT](#) topic. Use like a normal uint32\_t.

```
#include <mqtt.h>
```

Inherits [MQTT::mqtt\\_leaf](#).

## Public Member Functions

## 16.134.1 Detailed Description

Easy MqttObj class for automatically publishing and subscribing unsigned integer values to/from an [MQTT](#) topic. Use like a normal uint32\_t.

## 16.134.2 Constructor & Destructor Documentation

### 16.134.2.1 mqtt\_uint() [1/4]

```
MQTT::mqtt_uint::mqtt_uint (
 uint32_t val,
 const char * topic,
 Client * client,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_uint](#) object.

#### Parameters

|                |                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>val</i>     | Initial value for the integer                                                                                                      |
| <i>*topic</i>  | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>   | Behavioral flags to set on the created object                                                                                      |

### 16.134.2.2 mqtt\_uint() [2/4]

```
MQTT::mqtt_uint::mqtt_uint (
 const char * topic,
 Client * client,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a standalone [mqtt\\_uint](#) object.

## Parameters

|                |                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>*topic</i>  | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i> | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>   | Behavioral flags to set on the created object                                                                                      |

**16.134.2.3 mqtt\_uint() [3/4]**

```
MQTT::mqtt_uint::mqtt_uint (
 mqtt_leaf & parent,
 uint32_t val,
 const char * topic,
 Client * client,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_uint](#) object that has a parent.

## Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>val</i>         | Initial value for the integer                                                                                                      |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i>     | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

**16.134.2.4 mqtt\_uint() [4/4]**

```
MQTT::mqtt_uint::mqtt_uint (
 mqtt_leaf & parent,
 const char * topic,
 Client * client,
 uint16_t flags = (eObj_Flag_PubOnWrite|eObj_Flag_Subscribe|eObj_Flag_Sub_NoLocal))
```

Constructor for a [mqtt\\_uint](#) object that has a parent.

## Parameters

|                    |                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>&amp;parent</i> | Reference to parent MqttObj                                                                                                        |
| <i>*topic</i>      | Mqtt Topic Name to use for Publish/Subscribe.                                                                                      |
| <i>*client</i>     | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>       | Behavioral flags to set on the created object                                                                                      |

**16.134.3 Member Function Documentation****16.134.3.1 operator unsigned()**

```
MQTT::mqtt_uint::operator unsigned () const [inline]
```

Unsigned integer conversion operator for [mqtt\\_uint](#). Returns the value of the object as an unsigned int.

## Returns

The unsigned integer value of the object

**16.134.3.2 operator++()** [1/2]

`mqtt_uint & MQTT::mqtt_uint::operator++ () [inline]`  
 Preincrement the object.

**Returns**

Reference to the object

**16.134.3.3 operator++()** [2/2]

`uint32_t MQTT::mqtt_uint::operator++ (int ) [inline]`  
 Postincrement the object.

**Returns**

The unsigned integer value before being incremented

**16.134.3.4 operator--()** [1/2]

`mqtt_uint & MQTT::mqtt_uint::operator-- () [inline]`  
 Predecrement the object.

**Returns**

Reference to the object

**16.134.3.5 operator--()** [2/2]

`uint32_t MQTT::mqtt_uint::operator-- (int ) [inline]`  
 Postdecrement the object.

**Returns**

The unsigned integer value before being decremented

**16.134.3.6 operator=()**

`mqtt_uint & MQTT::mqtt_uint::operator= (uint32_t i)`

Assignment operator for `mqtt_uint`. Assigns the value to the object, then performs any post assignment operations.

**Parameters**

|          |                                    |
|----------|------------------------------------|
| <i>i</i> | The value to assign to the object. |
|----------|------------------------------------|

**Returns**

A reference to the object being assigned to.

**16.134.3.7 ParseFd()**

`virtual int MQTT::mqtt_uint::ParseFd (int mqttFd) [override], [protected], [virtual]`

the data from a file descriptor according to this object's current default serialization method and assign the value.

## Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

## Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

**16.134.3.8 RenderToBuffer()**

```
virtual int MQTT::mqtt_uint::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [virtual]
```

Render this object to an output buffer.

## Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.134.3.9 RenderToFd()**

```
virtual int MQTT::mqtt_uint::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [virtual]
```

Render this object to an output socket.

## Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

## Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

**16.134.3.10 SubscribeEvent()**

```
virtual int MQTT::mqtt_uint::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

**Returns**

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.134.3.11 TestOrSetValue()**

```
virtual ValueTestResult MQTT::mqtt_uint::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

**Parameters**

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

**Returns**

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

- `bool Interpolate ()`  
*Perform an in-place string interpolation. This allows NBStrings to easily access the NetBurner Config System, as in:*

### 16.136.1 Detailed Description

A wrapper for `NBString::Interpolate()` ideal for easy access to ephemeral values.

The NetBurner string interpolation system is a powerful and easy way to read system data and should be used carefully. For example, it would be unwise to allow untrusted user input to affect these interpolation commands, in case there is any information in the Config system that you don't want public. Normal sanity checking of regular user input is also advisable.

Syntax is similar to `vim` or `ex` commands, but simplified. There are currently two commands:

- `d` deletes matching substrings
- `s` replaces matching substrings

{ and } surround the interpolation command including any Config system variable name/path. Colons separate names, commands, and arguments. Semicolons allow command chaining. { { or } } are escaped curly braces. \ : can escape colons (actually "\ : " when writing C++ code, since \ is also a C++ escape character)

For example, if the config variable `AppData.foo` is "a\_b\_c\_d", then

```
NBInterpolatedString example("{AppData.foo:d:_;}");
example.Interpolate();
```

Would result in `example` equalling "abcd".

Commands can be chained with ; – if the config variable `AppData.foo` is "2\_3\_4\_5es", then

```
NBInterpolatedString example("{AppData.foo:d:_;s:2345:potato;}");
example.Interpolate();
```

Would result in `example` equalling "potatoes".

Commands are processed from left to right. If the config same variable `AppData.foo` of "2\_3\_4\_5es" is interpolated like this:

```
NBInterpolatedString example("{AppData.foo:s:2345:potato;d:_;}");
example.Interpolate();
```

It would instead would yield "2345es".

In our PubSub, Config, and SubHandler [MQTT](#) examples, we remove the first three octets of a known MAC address as well as the remaining semicolons with an interpolator like this: `{Sys.NetIf.Ethernet0.MAC:d:00\:\:03\:\:F4\:\;;d:\:\:}`

In order, this does the following:

- `Sys.NetIf.Ethernet0.MAC` obtains the matching Config string (visible at <http://<your device ip or hostname>:20034/UI.html>)
- `:` separates commands from config variable path
- `d:` delete the following literal substring:
- `00\:\:03\:\:F4\:\:` "00:03:F4:"
- `;` end command, begin new command with previous command's output as input
- `d:` delete the following literal substring:
- `\:\:` any/all colons remaining in the string

Thus a MAC address like 00:03:F4:12:34:56 will become 123456 in the resulting output.

### 16.136.2 Constructor & Destructor Documentation

#### 16.136.2.1 NBInterpolatedString() [1/4]

```
NBInterpolatedString::NBInterpolatedString (
 const NBString & str)
```

Construct a new `NBInterpolatedString` object from an existing `NBInterpolatedString` object.

## Parameters

|            |                                                      |
|------------|------------------------------------------------------|
| <i>str</i> | Existing <a href="#">NBInterpolatedString</a> object |
|------------|------------------------------------------------------|

**16.136.2.2 NBInterpolatedString()** [2/4]

```
NBInterpolatedString::NBInterpolatedString (
 const NBString & str,
 size_t pos,
 size_t len = npos)
```

Construct a new [NBInterpolatedString](#) object from a substring of an existing [NBInterpolatedString](#) object.

## Parameters

|            |                                                      |
|------------|------------------------------------------------------|
| <i>str</i> | Existing <a href="#">NBInterpolatedString</a> object |
| <i>pos</i> | Starting position to copy                            |
| <i>len</i> | Ending position to copy                              |

**16.136.2.3 NBInterpolatedString()** [3/4]

```
NBInterpolatedString::NBInterpolatedString (
 const char * s)
```

Construct a [NBInterpolatedString](#) object from a character string (null terminated array of characters)

## Parameters

|          |                             |
|----------|-----------------------------|
| <i>s</i> | String to initialize object |
|----------|-----------------------------|

**16.136.2.4 NBInterpolatedString()** [4/4]

```
NBInterpolatedString::NBInterpolatedString (
 const char * s,
 size_t n)
```

Construct a [NBInterpolatedString](#) object from a character string up to the specified amount.

## Parameters

|          |                              |
|----------|------------------------------|
| <i>s</i> | String to initialize object  |
| <i>n</i> | Number of characters to copy |

**16.136.3 Member Function Documentation****16.136.3.1 Append()**

```
NBString & NBInterpolatedString::Append (
 const char * str,
 size_t len)
```

Append a string to an existing [NBString](#) object.

Append a string to an existing [NBString](#) object

## Parameters

|            |                                |
|------------|--------------------------------|
| <i>str</i> | String to append               |
| <i>len</i> | Number of characters to append |

**Returns**

The updated [NBString](#) object

**16.136.3.2 FdAppend()**

```
NBString & NBInterpolatedString::FdAppend (
 int fd,
 size_t len)
```

Append from a file descriptor to an existing [NBString](#) object.

Append from a file descriptor to an existing [NBString](#) object

**Parameters**

|            |                                |
|------------|--------------------------------|
| <i>fd</i>  | File descriptor to append from |
| <i>len</i> | Number of characters to append |

**Returns**

The updated [NBString](#) object

**16.136.3.3 Interpolate()**

```
NBInterpolatedString & NBInterpolatedString::Interpolate ()
```

Perform a string interpolation in-place. This allows [NBStrings](#) to easily access the NetBurner Config System, as in:

```
NBInterpolatedString test("My MAC: {Sys.NetIf.Ethernet0.MAC} \n");
test.Interpolate();
```

**See also**

[NBString::Interpolate\(\)](#)

The documentation for this class was generated from the following file:

- nbstring.h

**16.137 NBString Class Reference**

Lightweight alternative to C++ CString class.

```
#include <nbstring.h>
```

Inherited by [NBInterpolatedString](#), [String](#), [String](#), [String](#), and [String](#).

  - Perform a string interpolation and place the finished interpolation in the Destination string. This allows NBStrings to easily access the NetBurner Config System, as in:*
- bool `Interpolate ()`
  - Perform an in-place string interpolation. This allows NBStrings to easily access the NetBurner Config System, as in:*

## Friends

- void `swap (NBString &x, NBString &y)`
  - Swaps the contents of two NBString objects.*

## 16.137.1 Detailed Description

Lightweight alternative to C++ CString class.

## 16.137.2 Constructor & Destructor Documentation

### 16.137.2.1 NBString() [1/5]

```
NBString::NBString (
 const NBString & str)
```

Construct a new NBString object from an existing NBString object.

#### Parameters

|            |                          |
|------------|--------------------------|
| <i>str</i> | Existing NBString object |
|------------|--------------------------|

### 16.137.2.2 NBString() [2/5]

```
NBString::NBString (
 const NBString & str,
 size_t pos,
 size_t len = npos)
```

Construct a new NBString object from a substring of an existing NBString object.

#### Parameters

|            |                           |
|------------|---------------------------|
| <i>str</i> | Existing NBString object  |
| <i>pos</i> | Starting position to copy |
| <i>len</i> | Ending position to copy   |

### 16.137.2.3 NSString() [3/5]

```
NSString::NSString (
 const char * s)
```

Construct a [NSString](#) object from a character string (null terminated array of characters)

#### Parameters

|          |                             |
|----------|-----------------------------|
| <i>s</i> | String to initialize object |
|----------|-----------------------------|

### 16.137.2.4 NSString() [4/5]

```
NSString::NSString (
 const char * s,
 size_t n)
```

Construct a [NSString](#) object from a character string up to the specified amount.

#### Parameters

|          |                              |
|----------|------------------------------|
| <i>s</i> | String to initialize object  |
| <i>n</i> | Number of characters to copy |

### 16.137.2.5 NSString() [5/5]

```
NSString::NSString (
 const JsonRef & jr)
```

Construct a [NSString](#) object using the current string referenced by a [JsonRef](#). This allows for using Large Strings without an intermediate malloc in the JsonParser.

#### Parameters

|           |                                              |
|-----------|----------------------------------------------|
| <i>jr</i> | <a href="#">JsonRef</a> to initialize object |
|-----------|----------------------------------------------|

## 16.137.3 Member Function Documentation

### 16.137.3.1 Append()

```
NSString & NSString::Append (
 const char * str,
 size_t len)
```

Append a string to an existing [NSString](#) object.

Append a string to an existing [NSString](#) object

#### Parameters

|            |                                |
|------------|--------------------------------|
| <i>str</i> | String to append               |
| <i>len</i> | Number of characters to append |

#### Returns

The updated [NSString](#) object

**16.137.3.2 c\_str()**

```
const char * NBString::c_str () const
```

Method to pass a [NBString](#) as a constant char \*.

Will cause an allocation if it is pointing to a constant string longer than the currently allocated length.

**Returns**

A null terminated character array representing the string

**16.137.3.3 clear()**

```
void NBString::clear ()
```

Clear a [NBString](#) object and free allocated memory.

Clear a [NBString](#) object and free allocated memory

**16.137.3.4 compare() [1/2]**

```
int NBString::compare (
 const char * s) const
```

Compares the [NBString](#) object to a character string.

**Parameters**

|          |                   |
|----------|-------------------|
| <i>s</i> | String to compare |
|----------|-------------------|

**Return values**

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>0</i>  | If identical                                           |
| <i>-1</i> | If <a href="#">NBString</a> object is less than str    |
| <i>1</i>  | If <a href="#">NBString</a> object is greater than str |

**16.137.3.5 compare() [2/2]**

```
int NBString::compare (
 const NBString & str) const
```

Compares two [NBString](#) objects.

**Parameters**

|            |                                            |
|------------|--------------------------------------------|
| <i>str</i> | <a href="#">NBString</a> object to compare |
|------------|--------------------------------------------|

**Return values**

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>0</i>  | If identical                                           |
| <i>-1</i> | If <a href="#">NBString</a> object is less than str    |
| <i>1</i>  | If <a href="#">NBString</a> object is greater than str |

**16.137.3.6 copy()**

```
size_t NBString::copy (
 char * s,
 size_t len,
 size_t pos = 0) const
```

Copy a substring, does not null terminate.

## Parameters

|            |                           |
|------------|---------------------------|
| <i>s</i>   | Destination               |
| <i>len</i> | Size of destination       |
| <i>pos</i> | Starting position of copy |

## Returns

Number of bytes copied

**16.137.3.7 empty()**

```
bool NSString::empty () const
```

Check if a string is empty.

Check if a [NSString](#) object is empty

## Return values

|              |                      |
|--------------|----------------------|
| <i>true</i>  | String is null       |
| <i>false</i> | String contains data |

**16.137.3.8 FdAppend()**

```
NSString & NSString::FdAppend (
 int fd,
 size_t len)
```

Append from a file descriptor to an existing [NSString](#) object.

Append from a file descriptor to an existing [NSString](#) object

## Parameters

|            |                                |
|------------|--------------------------------|
| <i>fd</i>  | File descriptor to append from |
| <i>len</i> | Number of characters to append |

## Returns

The updated [NSString](#) object

**16.137.3.9 find() [1/4]**

```
size_t NSString::find (
 char c,
 size_t pos = 0) const
```

Find the first occurrence of a character within the [NSString](#) object.

## Parameters

|            |                                   |
|------------|-----------------------------------|
| <i>c</i>   | Character to search for           |
| <i>pos</i> | Starting position to start search |

## Return values

|               |                        |
|---------------|------------------------|
| <i>&gt;=0</i> | Position in string     |
| <i>-1</i>     | If character not found |

**16.137.3.10 find() [2/4]**

```
size_t NBString::find (
 const char * s,
 size_t pos,
 size_t n) const
```

Find a substring within a character string.

**Parameters**

|            |                                         |
|------------|-----------------------------------------|
| <i>s</i>   | String to search                        |
| <i>pos</i> | Starting position to start search       |
| <i>n</i>   | Number of characters that have to match |

**Return values**

|          |                             |
|----------|-----------------------------|
| $\geq 0$ | Position in searched string |
| -1       | If substring not found      |

**16.137.3.11 find() [3/4]**

```
size_t NBString::find (
 const char * str,
 size_t pos = 0) const
```

Find a substring within a character string.

**Parameters**

|            |                                   |
|------------|-----------------------------------|
| <i>str</i> | String to search                  |
| <i>pos</i> | Starting position to start search |

**Return values**

|          |                             |
|----------|-----------------------------|
| $\geq 0$ | Position in searched string |
| -1       | If substring not found      |

**16.137.3.12 find() [4/4]**

```
size_t NBString::find (
 const NBString str,
 size_t pos = 0) const
```

Find a substring within a [NBString](#) object.

**Parameters**

|            |                                   |
|------------|-----------------------------------|
| <i>str</i> | NString object to search          |
| <i>pos</i> | Starting position to start search |

**Return values**

|          |                             |
|----------|-----------------------------|
| $\geq 0$ | Position in searched string |
| -1       | If substring not found      |

**16.137.3.13 Interpolate() [1/2]**

```
bool NBString::Interpolate () [inline]
```

Perform an in-place string interpolation. This allows NBStrings to easily access the NetBurner Config System, as in:

```
NBString test("My MAC: {Sys.NetIf.Ethernet0.MAC} \n");
test.Interpolate();
```

**See also**

[NBInterpolatedString](#)

**Returns**

Whether the interpolation was successful

**16.137.3.14 Interpolate() [2/2]**

```
bool NBString::Interpolate (
 NBString & dest)
```

Perform a string interpolation and place the finished interpolation in the Destination string. This allows NBStrings to easily access the NetBurner Config System, as in:

```
NBString test("My MAC: {Sys.NetIf.Ethernet0.MAC} \n");
NBString interpolated;
test.Interpolate(interpolated);
```

**See also**

[NBInterpolatedString](#)

**Parameters**

|             |                    |
|-------------|--------------------|
| <i>dest</i> | Destination string |
|-------------|--------------------|

**Returns**

Whether the interpolation was successful

**16.137.3.15 length()**

```
size_t NBString::length () const
```

Returns the length of the string.

**Returns**

The length of the string

**16.137.3.16 replace() [1/2]**

```
size_t NBString::replace (
 char c,
 char rep,
 size_t startPos = 0,
 size_t end = 0)
```

Replace all occurrences of all "<findStr>" characters within the [NBString](#) object.

**Parameters**

|                 |                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------|
| <i>c</i>        | Character to be replaced within the <a href="#">NBString</a>                              |
| <i>rep</i>      | Character to replace with                                                                 |
| <i>startPos</i> | Starting position to start replacing                                                      |
| <i>end</i>      | Replace all matching characters before this position, 0 = end of <a href="#">NBString</a> |

## Return values

|              |                                |
|--------------|--------------------------------|
| <i>&gt;0</i> | Number of Replaced Characters  |
| <i>-1</i>    | If no matching character found |

**16.137.3.17 replace()** [2/2]

```
size_t NSString::replace (
 const char * findStr,
 char rep,
 size_t startPos = 0,
 size_t end = 0)
```

Replace all occurrences of all "<findStr>" characters within the [NSString](#) object.

## Parameters

|                 |                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------|
| <i>findStr</i>  | String of characters to be replaced within the <a href="#">NSString</a>                   |
| <i>rep</i>      | Character to replace with                                                                 |
| <i>startPos</i> | Starting position to start replacing                                                      |
| <i>end</i>      | Replace all matching characters before this position, 0 = end of <a href="#">NSString</a> |

## Return values

|              |                                |
|--------------|--------------------------------|
| <i>&gt;0</i> | Number of Replaced Characters  |
| <i>-1</i>    | If no matching character found |

**16.137.3.18 Reserve()**

```
NSString & NSString::Reserve (
 size_t len)
```

Reserve an additional buffer amount.

Reserve an additional buffer amount to prepare for a series of Appends

## Parameters

|            |                                                     |
|------------|-----------------------------------------------------|
| <i>len</i> | Number of additional characters to prepare to store |
|------------|-----------------------------------------------------|

## Returns

The updated [NSString](#) object

**16.137.3.19 sprintf()** [1/2]

```
int NSString::sprintf (
 const char * format,
 ...)
```

isprintf (integer) to a string with formatting to a character array

## Parameters

|               |                         |
|---------------|-------------------------|
| <i>format</i> | printf style formatting |
|---------------|-------------------------|

**16.137.3.20 siprintf()** [2/2]

```
int NSString::siprintf (
 NSString const format,
 ...)
```

isprintf (integer) to a string with formatting to a [NSString](#) object

**Parameters**

|               |                         |
|---------------|-------------------------|
| <i>format</i> | printf style formatting |
|---------------|-------------------------|

**16.137.3.21 size()**

```
size_t NSString::size () const
```

Returns the current size of memory allocated for the string.

**Returns**

Total size of the object in bytes

**16.137.3.22 sprintf()** [1/2]

```
int NSString::sprintf (
 const char * format,
 ...)
```

sprintf to a string with formatting to a character array

**Parameters**

|               |                         |
|---------------|-------------------------|
| <i>format</i> | printf style formatting |
|---------------|-------------------------|

**16.137.3.23 sprintf()** [2/2]

```
int NSString::sprintf (
 NSString const format,
 ...)
```

sprintf to a string with formatting as a [NSString](#) object

**Parameters**

|               |                         |
|---------------|-------------------------|
| <i>format</i> | printf style formatting |
|---------------|-------------------------|

**16.137.3.24 stod()**

```
double NSString::stod () const
```

Parse the string value and convert to a const double float number.

**Returns**

const double float value

**16.137.3.25 stoi()**

```
int NSString::stoi () const
```

Parse the string and convert to an integer number.

**Returns**

integer value

**16.137.3.26 stol()**

```
long NBString::stol () const
```

Parse the string value and convert to a long integer number.

**Returns**

long integer value

**16.137.3.27 stoui()**

```
unsigned int NBString::stoui () const
```

Parse the string value and convert to a const integer number.

**Returns**

unsigned integer value

**16.137.3.28 stoul()**

```
unsigned long NBString::stoul () const
```

Parse the string value and convert to a const unsigned long integer number.

**Returns**

unsigned long integer value

**16.137.3.29 strcpy()**

```
size_t NBString::strcpy (
 char * s,
 size_t len,
 size_t pos = 0) const
```

Copy a substring, with null termination.

**Parameters**

|            |                           |
|------------|---------------------------|
| <i>s</i>   | Destination               |
| <i>len</i> | Size of destination       |
| <i>pos</i> | Starting position of copy |

**Returns**

Number of bytes copied

**16.137.3.30 substr()**

```
NBString NBString::substr (
 size_t pos = 0,
 size_t len = npos) const
```

Creates a new [NBString](#) object from a substring of the existing [NBString](#) object.

**Parameters**

|            |                                |
|------------|--------------------------------|
| <i>pos</i> | Starting position of substring |
| <i>len</i> | Number of characters to copy   |

**Returns**

A [NBString](#) object

**16.137.3.31 to\_ipaddr()**

```
IPADDR NBString::to_ipaddr () const
```

Parse the string value and convert to an IPADDR IP address.

**Returns**

const double float value

**16.137.3.32 vsiprintf()**

```
int NBString::vsiprintf (
 const char * format,
 va_list & vl)
```

Print to a string with formatting.

**Parameters**

|               |                         |
|---------------|-------------------------|
| <i>format</i> | printf style formatting |
| <i>vl</i>     | Variable argument list  |

**16.137.4 Friends And Related Symbol Documentation****16.137.4.1 swap**

```
void swap (
 NBString & x,
 NBString & y) [friend]
```

Swaps the contents of two [NBString](#) objects.

Useful for optimizing sorts. Friend function that takes two [NBString](#) objects as parameters and swaps their contents.

The documentation for this class was generated from the following file:

- nbstring.h

**16.138 NTPServer Class Reference**

```
#include <NTPServer.h>
```

**Classes**

- class [NtpTimeStamp](#)

**Public Member Functions**

- [NTPServer](#) ([IEEE1588Timer](#) &timer, GPSChip &gps, uint16\_t port=123)
- bool [start](#) ()
- void [stop](#) ()
- bool [isRunning](#) () const
- uint16\_t [getPort](#) () const

**Static Public Member Functions**

- static void [serverTask](#) (void \*param)

**16.138.1 Detailed Description**

[NTPServer](#) class - Encapsulates NTP server functionality

This class provides a complete NTP server implementation that uses [IEEE1588Timer](#) for precise timestamping and GPS synchronization. It handles NTP packet processing and response generation.

## 16.138.2 Constructor & Destructor Documentation

### 16.138.2.1 NTPServer()

```
NTPServer::NTPServer (
 IEEE1588Timer & timer,
 GPSChip & gps,
 uint16_t port = 123)
```

Constructor

#### Parameters

|              |                                                                     |
|--------------|---------------------------------------------------------------------|
| <i>timer</i> | Reference to <a href="#">IEEE1588Timer</a> for precise timestamping |
| <i>gps</i>   | Reference to GPSChip for GPS synchronization status                 |
| <i>port</i>  | NTP server port (default 123)                                       |

## 16.138.3 Member Function Documentation

### 16.138.3.1 getPort()

```
uint16_t NTPServer::getPort () const [inline]
```

Get server port

#### Returns

NTP server port number

### 16.138.3.2 isRunning()

```
bool NTPServer::isRunning () const [inline]
```

Get server running status

#### Returns

true if server is running

### 16.138.3.3 serverTask()

```
void NTPServer::serverTask (
 void * param) [static]
```

Static task wrapper for RTOS

#### Parameters

|              |                                               |
|--------------|-----------------------------------------------|
| <i>param</i> | Pointer to <a href="#">NTPServer</a> instance |
|--------------|-----------------------------------------------|

### 16.138.3.4 start()

```
bool NTPServer::start ()
```

Start the NTP server Registers UDP FIFO and creates server task

#### Returns

true if server started successfully

**16.138.3.5 stop()**

```
void NTPServer::stop ()
```

Stop the NTP server Cleanup method for future use

The documentation for this class was generated from the following files:

- NTPServer.h
- NTPServer.cpp

**16.139 NTPServer::NtpTimeStamp Class Reference**

```
#include <NTPServer.h>
```

**Public Member Functions**

- bool [SetFrom](#) (uint32\_t tt, uint32\_t From1588)
- [NtpTimeStamp](#) ()
- [NtpTimeStamp](#) & [operator=](#) (UDPPacket &upkt)
- [NtpTimeStamp](#) & [operator=](#) (const [NtpTimeStamp](#) &src)

**Static Public Member Functions**

- static [NtpTimeStamp Now](#) ()

**Public Attributes**

- beuint32\_t **sec**  
*Seconds since NTP epoch (big endian)*
- beuint32\_t **frac**  
*Fractional seconds (big endian)*

**16.139.1 Detailed Description**

[NtpTimeStamp](#) struct - Represents an NTP timestamp

NTP timestamps are 64-bit values with 32-bit seconds and 32-bit fraction The epoch is January 1, 1900 00:00:00 UTC

**16.139.2 Constructor & Destructor Documentation****16.139.2.1 NtpTimeStamp()**

```
NTPServer::NtpTimeStamp::NtpTimeStamp () [inline]
```

Default constructor - initializes to zero

**16.139.3 Member Function Documentation****16.139.3.1 Now()**

```
NTPServer::NtpTimeStamp NTPServer::NtpTimeStamp::Now () [static]
```

Create timestamp for current time

Returns

[NtpTimeStamp](#) representing current time

**16.139.3.2 operator=() [1/2]**

```
NTPServer::NtpTimeStamp & NTPServer::NtpTimeStamp::operator= (
 const NtpTimeStamp & src)
```

Copy assignment operator

## Parameters

|            |                          |
|------------|--------------------------|
| <i>src</i> | Source timestamp to copy |
|------------|--------------------------|

## Returns

Reference to this timestamp

**16.139.3.3 operator=()** [2/2]

```
NTPServer::NtpTimeStamp & NTPServer::NtpTimeStamp::operator= (
 UDPacket & upkt)
```

Extract timestamp from UDP packet Uses packet timing information to create precise timestamp

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>upkt</i> | Reference to UDP packet |
|-------------|-------------------------|

## Returns

Reference to this timestamp

**16.139.3.4 SetFrom()**

```
bool NTPServer::NtpTimeStamp::SetFrom (
 uint32_t tt,
 uint32_t From1588)
```

Set timestamp from OS tick and 1588 timer values

## Parameters

|                 |                  |
|-----------------|------------------|
| <i>tt</i>       | OS tick count    |
| <i>From1588</i> | 1588 timer value |

## Returns

true if timestamp was set successfully, false if no valid GPS time

The documentation for this class was generated from the following files:

- NTPServer.h
- NTPServer.cpp

**16.140 ParsedJsonDataSet Class Reference**

A class to create, read, and modify a JSON object.

```
#include <json_lexer.h>
```

Inherits [buffer\\_object](#).

Inherited by [AcmeServletBuffer](#), and [JsonLexerFDAdapter](#).

**Public Member Functions****Parsing**

*Ingesting raw JSON data from some source, or resetting. Enables compatibility with [buffer\\_object](#) and [WebClient](#).*

- void **EnableLargeStrings** (bool b)  
*Call to allow allocation of strings larger than 1500 bytes.*
- virtual int **WriteData** (const unsigned char \*pCopyFrom, int numBytes)  
*Writes the passed in data to the JSON data set.*
- virtual int **ReadFrom** (int fd)  
*Reads in data from the specified file descriptor and parses it into the JSON data set.*
- bool **CopyObject** (ParsedJsonDataSet &src\_set)  
*Copies the provided JSON data set into the current one.*
- void **ClearObject** ()  
*Clears all data from the object and resets it to its initial state.*

### Querying the Data Structure

*Allows easy retrieval of entities by array index or object key name*

#### Example

```
printf("User %d name %s",
 (int)myJsonRef("users")[0]("id"),
 (const char *)myJsonRef("users")[0]("name")
);
```

- **JsonRef operator[]** (int i)  
*Get a [JsonRef](#) from an array by numerical index.*
- **JsonRef operator()** (const char \*name)  
*Get a [JsonRef](#) representing any entity from a parent object by key name.*
- **JsonRef name** (const char \*name)  
*Get a [JsonRef](#) representing any entity from a parent object by key name.*
- **JsonRef object** (const char \*name)  
*Get a [JsonRef](#) representing an object from a parent object by key name.*

### Traversing the Data Structure

*Used for scanning through the JSON elements*

- **JsonRef start** ()  
*Begin traversal: check for ref validity and reset the position.*
- **JsonRef next** ()  
*Traverse: check for ref validity and increment the position.*
- **json\_primitive\_type GetFirst** ()  
*Get the first element of the JSON data set.*
- **json\_primitive\_type GetNext** ()  
*Get the element at the next position of the JSON data set.*
- **json\_primitive\_type GetCurrent** ()  
*Get the element at the current position of the JSON data set.*
- **json\_primitive\_type GetRawCurrent** ()  
*Get the element at the current position of the JSON data set, including non-public types.*
- **json\_primitive\_type GetNextName** ()  
*Iterates the current element of the JSON data set until it finds one of type NAME.*
- **json\_primitive\_type GetNextObject** ()  
*Get the next element of type name that exists in the current OBJECT after the current position.*
- **json\_primitive\_type GetNextArray** ()  
*Iterates the current element of the JSON data set until it finds one of type BEGIN\_ARRAY.*
- **json\_primitive\_type GetNextNameInCurrentObject** ()  
*Get the next element of type NAME that exists in the current OBJECT after the current position.*
- **json\_primitive\_type GetNextNameInCurrentArray** ()  
*Get the next element of type NAME that exists in the current ARRAY after the current position.*
- **json\_primitive\_type GetNextNumberInCurrentArray** ()  
*Get the next element of type NUMBER that exists in the current ARRAY after the current position.*
- **json\_primitive\_type GetNextStringInCurrentArray** ()  
*Get the next element of type STRING that exists in the current ARRAY after the current position.*
- **json\_primitive\_type GetNextBoolInCurrentArray** ()  
*Get the next element of type TRUE\_EL that exists in the current ARRAY after the current position.*

- [json\\_primitive\\_type GetNextObjectInCurrentArray \(\)](#)  
*Get the next element of type BEGIN\_OBJECT that exists in the current ARRAY after the current position.*
- [json\\_primitive\\_type SkipCurrentValue \(\)](#)  
*Skips over the current value, and get the next element. If called inside an ARRAY or OBJECT, it will walk to the end of the ARRAY or OBJECT and return the next element it finds. If it reaches the end of the ARRAY or OBJECT before it finds a value, it will return NOTFOUND.*
- void [ResetPosition \(\)](#)  
*Resets the parser position to the beginning of the JSON data set.*
- [JsonRef GetParsePosition \(\)](#)  
*Gets the current parse position object for the JSON data set.*
- [JsonRef SetParsePosition \(JsonRef pos\)](#)  
*Sets the current parse position object for the JSON data set.*

### Advanced Finding and Returning

Advanced functions for scanning and returning specific objects. All of these can return NOTFOUND.

#### Example

*This function works with dotted string notation to find sub elements:*

```
{
 "SUCCESS": true,
 "ACTION": null,
 "JDATA": {
 "foo": 7,
 "bar": {
 "b1": "Sb1",
 "b2": {
 "s1": "Sub1",
 "s2": "Sub2",
 "s3": "Sub3",
 "s4": {
 "Sub4a": "Test4a",
 "Sub4b": "Test4b"
 },
 "s5": "Sub5",
 "s6": "Sub6"
 },
 "b3": true,
 "b4": null
 },
 "bogus": "Bstring",
 "nubog": 1234.57,
 "av": [
 1,
 2,
 3,
 4,
 5,
 6,
 7,
 8,
 9,
 10
],
 "aftaav": true
 }
}
```

*You could return the "Sub4b" element's "Test4b" string with:*

```
myParsedJsonDataSet.FindFullName("JDATA.bar.b2.s4.Sub4b");
```

- [json\\_primitive\\_type FindFullName \(const char \\*name\)](#)  
*Find the element in the data set with the given name and move the parser to the next element. This searches a full name path, such as ob1.ob2.ob3.ob4.*
- [json\\_primitive\\_type FindFullAtName \(const char \\*name\)](#)  
*Find the element in the data set with the given name and move the parser to that element. This searches a full name path, such as ob1.ob2.ob3.ob4.*
- [json\\_primitive\\_type FindElementAfterName \(const char \\*name\)](#)  
*Finds name in current object points at element after name. This only supports simple, single element names. This searches from the current position to the end.*
- [json\\_primitive\\_type FindGlobalElementAfterName \(const char \\*name\)](#)  
*Finds name in current object points at element after name. This only supports simple, single element names. It starts the search from the parser's current position, and if it doesn't find it, it will start the search over from the beginning.*

- [json\\_primitive\\_type FindElementAfterNameInCurrentObject](#) (const char \*name)  
*Looks for elements with the current name in the current OBJECT only. Does not search sub objects.*
- [json\\_primitive\\_type FindElementAfterNameInCurrentArray](#) (const char \*name)  
*Looks for elements with the current name in the current ARRAY only. Does not search sub arrays.*
- bool [CurrentBool](#) ()  
*Returns true if the current element a TRUE\_EL primitive type.*
- bool [PermissiveCurrentBool](#) ()  
*Returns true if the current element a TRUE\_EL primitive type, is "True", "true", or is a non-zero number.*
- double [CurrentNumber](#) ()  
*Get the number value of the current element.*
- const char \* [CurrentString](#) ()  
*Get the string value of the current element.*
- int [CopyCurrentString](#) (char \*buf, int buflen)  
*Copy the string value of the current element.*
- int [CopyCurrentString](#) (NBString &nbs)  
*Copy the string value of the current element.*
- const char \* [CurrentName](#) ()  
*Get the name of the current element.*
- bool [FindFullNameBoolean](#) (const char \*name)  
*Find the boolean value of a given element.*
- bool [FindGlobalBoolean](#) (const char \*name)  
*Find the boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- bool [FindBoolean](#) (const char \*name)  
*Find the boolean value of the element after the element with the given name.*
- bool [FindBooleanInCurentObject](#) (const char \*name)  
*Find the boolean value of the element within the current object. Does not search sub-objects.*
- bool [FindFullNamePermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of a given element.*
- bool [FindGlobalPermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- bool [FindPermissiveBoolean](#) (const char \*name)  
*Find the permissive boolean value of the element after the element with the provided name.*
- bool [FindPermissiveBooleanInCurentObject](#) (const char \*name)  
*Find the permissive boolean value of the element with the given name in the current object. Does not search sub-objects.*
- const char \* [FindFullNameString](#) (const char \*name)  
*Find the string value of the element with the given name in the current object.*
- int [FindAndCopyFullNameString](#) (const char \*name, char \*buf, int buflen)  
*Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- int [FindAndCopyFullNameString](#) (const char \*name, NBString &nbs)  
*Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- const char \* [FindGlobalString](#) (const char \*name)  
*Find the string value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*
- int [FindAndCopyGlobalString](#) (const char \*name, char \*buf, int buflen)  
*Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- int [FindAndCopyGlobalString](#) (const char \*name, NBString &nbs)  
*Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*
- const char \* [FindString](#) (const char \*name)  
*Find the string value of the element after the element with the given name.*
- int [FindAndCopyString](#) (const char \*name, char \*buf, int buflen)

*Find and copy the string value of the element with the given name. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*

- int [FindAndCopyString](#) (const char \*name, NBString &nbs)

*Find and copy the string value of the element with the given name. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.*

- const char \* [FindStringInCurentObject](#) (const char \*name)

*Find the string value of the element with the given name in the current object. Does not search sub-objects.*

- double [FindFullNameNumber](#) (const char \*name)

*Find the number value of the element with the given name in the current object.*

- double [FindGlobalNumber](#) (const char \*name)

*Find the number value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*

- double [FindNumber](#) (const char \*name)

*Find the number value of the element after the element with the given name.*

- double [FindNumberInCurentObject](#) (const char \*name)

*Find the number value of the element with the given name in the current object. Does not search sub-objects.*

- bool [FindGlobalObject](#) (const char \*name)

*Find the OBJECT with the given name. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.*

- bool [FindObject](#) (const char \*name)

*Find the OBJECT of the element after the element with the given name.*

- bool [FindObjectInCurentObject](#) (const char \*name)

*Find the OBJECT of the element with the given name in the current OBJECT. Does not search sub-objects.*

## Utility

*Ingesting raw JSON data from some source, or resetting*

- void **DumpState** ()  
*Outputs what's in the parse tree to stdout.*
- int [PrintObject](#) (bool pretty=false)  
*Prints the JSON data set to stdout.*
- int [PrintObjectToBuffer](#) (char \*buffer, int maxlen, bool pretty=false)  
*Prints the JSON data set to a provided buffer.*
- int [PrintObjectToFd](#) (int fd, bool pretty=false)  
*Prints the JSON data set to a specified file descriptor.*
- int [PrintObjectToString](#) (NBString &s, bool pretty=false)  
*Prints the JSON data set to a NBString object.*
- int **PrintChildren** (bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to stdout.*
- int **PrintChildrenToFd** (int fd, bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to a file descriptor.*
- int **PrintChildrenToBuffer** (char \*buffer, int maxlen, bool pretty=false)  
*Output child objects of this [JsonRef](#) as JSON text to a buffer pointer.*
- int [GetPrintSize](#) (bool pretty=false)  
*Calculates how many characters the JSON data set would take to print.*

## Building

*Programmatically creating or modifying a JSON dataset*

- [ParsedJsonDataSet](#) \* **StartBuilding** ()  
*Use to start building the JSON data set.*
- [ParsedJsonDataSet](#) \* [AddObjectStart](#) (const char \*name)  
*Use to start an object in the JSON data set.*
- [ParsedJsonDataSet](#) \* [AddMyMac](#) (const char \*name)  
*Add the device MAC address to the JSON data set.*
- [ParsedJsonDataSet](#) \* [Add](#) (const char \*name, int i)  
*Add a name/value pair to the JSON data set where the value is an int.*
- [ParsedJsonDataSet](#) \* [Add](#) (const char \*name, short i)  
*Add a name/value pair to the JSON data set where the value is a short.*
- [ParsedJsonDataSet](#) \* [Add](#) (const char \*name, long i)

- Add a name/value pair to the JSON data set where the value is a long.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, unsigned int i)
- Add a name/value pair to the JSON data set where the value is an unsigned int.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, unsigned short i)
- Add a name/value pair to the JSON data set where the value is a unsigned short.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, unsigned long i)
- Add a name/value pair to the JSON data set where the value is a unsigned long.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, double d)
- Add a name/value pair to the JSON data set where the value is a double.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, const char \*str)
- Add a name/value pair to the JSON data set where the value is a string.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, bool b)
- Add a name/value pair to the JSON data set where the value is a bool.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, IPADDR4 i4)
- Add a name/value pair to the JSON data set where the value is an IPv4 address.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, const IPADDR &i)
- Add a name/value pair to the JSON data set where the value is an IP address.*
- [ParsedJsonDataSet \\* Add](#) (const char \*name, const MACADDR &ma)
- Add a name/value pair to the JSON data set where the value is a MAC address.*
- [ParsedJsonDataSet \\* AddNull](#) (const char \*name)
- Add a name/value pair to the JSON data set where the value is null.*
- [ParsedJsonDataSet \\* AddArrayStart](#) (const char \*name)
- Add an ARRAY start to the JSON data set.*
- [ParsedJsonDataSet \\* EndArray](#) ()
- Add an ARRAY end to the JSON data set.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (int i)
- Add an integer value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (short i)
- Add a short value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (long i)
- Add a long value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (unsigned int i)
- Add an unsigned int value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (unsigned short i)
- Add an unsigned short value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (unsigned long i)
- Add an unsigned long value to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (double d)
- Add a double to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (const char \*str)
- Add a string to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (bool b)
- Add a bool to the current array.*
- [ParsedJsonDataSet \\* AddArrayElement](#) (const IPADDR &i)
- Add an IP address to the current array.*
- [ParsedJsonDataSet \\* AddArrayElementArray](#) ()
- Add the start of an array element to the current array.*
- [ParsedJsonDataSet \\* AddArrayObjectStart](#) ()
- Add the start of an object element to the current array.*
- [ParsedJsonDataSet \\* AddNullArrayElement](#) ()
- Add a null element to the current array.*
- [ParsedJsonDataSet \\* EndObject](#) ()
- Add an end to the current object.*
- [ParsedJsonDataSet \\* DoneBuilding](#) ()
- Add an end JSON data set and finish building.*

## Friends

- class [JsonRef](#)

### 16.140.1 Detailed Description

A class to create, read, and modify a JSON object.

Many of the methods on [ParsedJsonDataSet](#) return a [JsonRef](#) which is a pointer to a variable or sub object inside the [ParsedJsonDataSet](#). So, once data is parsed and traversal or querying has begun most of the work will be inside the [JsonRef](#) class.

### 16.140.2 Member Function Documentation

#### 16.140.2.1 Add() [1/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 bool b)
```

Add a name/value pair to the JSON data set where the value is a bool.

##### Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>b</i>    | The value for the pair. |

#### 16.140.2.2 Add() [2/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 const char * str)
```

Add a name/value pair to the JSON data set where the value is a string.

##### Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>name</i> | The name of the pair.                |
| <i>str</i>  | A pointer to the value for the pair. |

#### 16.140.2.3 Add() [3/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 const IPADDR & i)
```

Add a name/value pair to the JSON data set where the value is an IP address.

##### Parameters

|             |                        |
|-------------|------------------------|
| <i>name</i> | The name of the pair.  |
| <i>i</i>    | The IP address to add. |

#### 16.140.2.4 Add() [4/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 const MACADDR & ma)
```

Add a name/value pair to the JSON data set where the value is a MAC address.

##### Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>ma</i>   | The MAC address to add. |

**16.140.2.5 Add()** [5/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 double d)
```

Add a name/value pair to the JSON data set where the value is a double.

**Parameters**

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>d</i>    | The value for the pair. |

**16.140.2.6 Add()** [6/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 int i)
```

Add a name/value pair to the JSON data set where the value is an int.

**Parameters**

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.7 Add()** [7/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 IPADDR4 i4)
```

Add a name/value pair to the JSON data set where the value is an IPv4 address.

**Parameters**

|             |                          |
|-------------|--------------------------|
| <i>name</i> | The name of the pair.    |
| <i>i4</i>   | The IPv4 address to add. |

**16.140.2.8 Add()** [8/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 long i)
```

Add a name/value pair to the JSON data set where the value is a long.

**Parameters**

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.9 Add()** [9/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 short i)
```

Add a name/value pair to the JSON data set where the value is a short.

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.10 Add()** [10/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 unsigned int i)
```

Add a name/value pair to the JSON data set where the value is an unsigned int.

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.11 Add()** [11/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 unsigned long i)
```

Add a name/value pair to the JSON data set where the value is a unsigned long.

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.12 Add()** [12/12]

```
ParsedJsonDataSet * ParsedJsonDataSet::Add (
 const char * name,
 unsigned short i)
```

Add a name/value pair to the JSON data set where the value is a unsigned short.

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>name</i> | The name of the pair.   |
| <i>i</i>    | The value for the pair. |

**16.140.2.13 AddArrayElement()** [1/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 bool b)
```

Add a bool to the current array.

## Parameters

|          |                        |
|----------|------------------------|
| <i>b</i> | The bool value to add. |
|----------|------------------------|

**16.140.2.14 AddArrayElement()** [2/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 const char * str)
```

Add a string to the current array.

**Parameters**

|            |                                              |
|------------|----------------------------------------------|
| <i>str</i> | A char* pointing to the string value to add. |
|------------|----------------------------------------------|

**16.140.2.15 AddArrayElement()** [3/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 const IPADDR & i)
```

Add an IP address to the current array.

**Parameters**

|          |                        |
|----------|------------------------|
| <i>i</i> | The IP address to add. |
|----------|------------------------|

**16.140.2.16 AddArrayElement()** [4/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 double d)
```

Add a double to the current array.

**Parameters**

|          |                          |
|----------|--------------------------|
| <i>d</i> | The double value to add. |
|----------|--------------------------|

**16.140.2.17 AddArrayElement()** [5/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 int i)
```

Add an integer value to the current array.

**Parameters**

|          |                           |
|----------|---------------------------|
| <i>i</i> | The integer value to add. |
|----------|---------------------------|

**16.140.2.18 AddArrayElement()** [6/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 long i)
```

Add a long value to the current array.

**Parameters**

|          |                        |
|----------|------------------------|
| <i>i</i> | The long value to add. |
|----------|------------------------|

**16.140.2.19 AddArrayElement()** [7/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 short i)
```

Add a short value to the current array.

## Parameters

|          |                         |
|----------|-------------------------|
| <i>i</i> | The short value to add. |
|----------|-------------------------|

**16.140.2.20 AddArrayElement()** [8/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 unsigned int i)
```

Add an unsigned int value to the current array.

## Parameters

|          |                                |
|----------|--------------------------------|
| <i>i</i> | The unsigned int value to add. |
|----------|--------------------------------|

**16.140.2.21 AddArrayElement()** [9/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 unsigned long i)
```

Add an unsigned long value to the current array.

## Parameters

|          |                                 |
|----------|---------------------------------|
| <i>i</i> | The unsigned long value to add. |
|----------|---------------------------------|

**16.140.2.22 AddArrayElement()** [10/10]

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayElement (
 unsigned short i)
```

Add an unsigned short value to the current array.

## Parameters

|          |                                  |
|----------|----------------------------------|
| <i>i</i> | The unsigned short value to add. |
|----------|----------------------------------|

**16.140.2.23 AddArrayStart()**

```
ParsedJsonDataSet * ParsedJsonDataSet::AddArrayStart (
 const char * name)
```

Add an ARRAY start to the JSON data set.

## Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>name</i> | The name of the array to start. |
|-------------|---------------------------------|

**16.140.2.24 AddMyMac()**

```
ParsedJsonDataSet * ParsedJsonDataSet::AddMyMac (
 const char * name)
```

Add the device MAC address to the JSON data set.

## Parameters

|             |                                                   |
|-------------|---------------------------------------------------|
| <i>name</i> | The name of the field containing the MAC address. |
|-------------|---------------------------------------------------|

**16.140.2.25 AddNull()**

```
ParsedJsonDataSet * ParsedJsonDataSet::AddNull (
 const char * name)
```

Add a name/value pair to the JSON data set where the value is null.

**Parameters**

|             |                       |
|-------------|-----------------------|
| <i>name</i> | The name of the pair. |
|-------------|-----------------------|

**16.140.2.26 AddObjectStart()**

```
ParsedJsonDataSet * ParsedJsonDataSet::AddObjectStart (
 const char * name)
```

Use to start an object in the JSON data set.

**Parameters**

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the object to start. |
|-------------|----------------------------------|

**16.140.2.27 CopyCurrentString() [1/2]**

```
int ParsedJsonDataSet::CopyCurrentString (
 char * buf,
 int buflen) [inline]
```

Copy the string value of the current element.

**Returns**

The length of the current element if it is a STRING, ALLOC\_STRING, or STRING\_CHUNK. Otherwise it returns a 0.

**16.140.2.28 CopyCurrentString() [2/2]**

```
int ParsedJsonDataSet::CopyCurrentString (
 NBString & nbs) [inline]
```

Copy the string value of the current element.

**Returns**

The length of the current element if it is a STRING, ALLOC\_STRING, or STRING\_CHUNK. Otherwise it returns a 0.

**16.140.2.29 CopyObject()**

```
bool ParsedJsonDataSet::CopyObject (
 ParsedJsonDataSet & src_set)
```

Copies the provided JSON data set into the current one.

**Return values**

|              |                     |
|--------------|---------------------|
| <i>true</i>  | The copy succeeded. |
| <i>false</i> | The copy failed.    |

**16.140.2.30 CurrentBool()**

```
bool ParsedJsonDataSet::CurrentBool () [inline]
```

Returns true if the current element a TRUE\_EL primitive type.

## Return values

|              |                                                         |
|--------------|---------------------------------------------------------|
| <i>true</i>  | If the current element is a TRUE_EL primitive type.     |
| <i>false</i> | If the current element is not a TRUE_EL primitive type. |

**16.140.2.31 CurrentName()**

```
const char * ParsedJsonDataSet::CurrentName () [inline]
```

Get the name of the current element.

## Returns

A pointer to the name of the current element, if it has one. If it does not, it returns a 0.

**16.140.2.32 CurrentNumber()**

```
double ParsedJsonDataSet::CurrentNumber () [inline]
```

Get the number value of the current element.

## Returns

The number value if the current element's primitive type is NUMBER. Otherwise it returns a quite NAN.

**16.140.2.33 CurrentString()**

```
const char * ParsedJsonDataSet::CurrentString () [inline]
```

Get the string value of the current element.

## Returns

The a pointer to the string value of the current element if it is of primitive type STRING or ALLOC\_STRING. Otherwise it returns a 0.

**16.140.2.34 FindAndCopyFullNameString() [1/2]**

```
int ParsedJsonDataSet::FindAndCopyFullNameString (
 const char * name,
 char * buf,
 int buflen) [inline]
```

Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

## Parameters

|               |                                           |
|---------------|-------------------------------------------|
| <i>name</i>   | The full name of the element to find.     |
| <i>buf</i>    | The buffer to copy the string value to.   |
| <i>buflen</i> | The length of the buffer being copied to. |
|               | •                                         |

## Returns

Full length of the string, regardless of truncation

**16.140.2.35 FindAndCopyFullNameString() [2/2]**

```
int ParsedJsonDataSet::FindAndCopyFullNameString (
 const char * name,
 NBString & nbs) [inline]
```

Find and copy the string value of the element with the given name in the current object. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

## Parameters

|             |                                                                  |
|-------------|------------------------------------------------------------------|
| <i>name</i> | The full name of the element to find.                            |
| <i>nbs</i>  | The <a href="#">NBString</a> object to copy the string value to. |
|             | •                                                                |

## Returns

Full length of the string, regardless of truncation

**16.140.2.36 FindAndCopyGlobalString() [1/2]**

```
int ParsedJsonDataSet::FindAndCopyGlobalString (
 const char * name,
 char * buf,
 int buflen) [inline]
```

Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

## Parameters

|               |                                           |
|---------------|-------------------------------------------|
| <i>name</i>   | The full name of the element to find.     |
| <i>buf</i>    | The buffer to copy the string value to.   |
| <i>buflen</i> | The length of the buffer being copied to. |
|               | •                                         |

## Returns

Full length of the string, regardless of truncation

**16.140.2.37 FindAndCopyGlobalString() [2/2]**

```
int ParsedJsonDataSet::FindAndCopyGlobalString (
 const char * name,
 NBString & nbs) [inline]
```

Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names. It then copies the found string to the provided buffer. If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

## Parameters

|             |                                                                  |
|-------------|------------------------------------------------------------------|
| <i>name</i> | The full name of the element to find.                            |
| <i>nbs</i>  | The <a href="#">NBString</a> object to copy the string value to. |
|             | •                                                                |

## Returns

Full length of the string, regardless of truncation

**16.140.2.38 FindAndCopyString()** [1/2]

```
int ParsedJsonDataSet::FindAndCopyString (
 const char * name,
 char * buf,
 int buflen) [inline]
```

Find and copy the string value of the element with the given name If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

**Parameters**

|               |                                           |
|---------------|-------------------------------------------|
| <i>name</i>   | The name of the element to find.          |
| <i>buf</i>    | The buffer to copy the string value to.   |
| <i>buflen</i> | The length of the buffer being copied to. |
|               | •                                         |

**Returns**

Full length of the string, regardless of truncation

**16.140.2.39 FindAndCopyString()** [2/2]

```
int ParsedJsonDataSet::FindAndCopyString (
 const char * name,
 NBString & nbs) [inline]
```

Find and copy the string value of the element with the given name If not provided a buffer or the provided buffer is insufficient, the string will be truncated in the copy buffer.

**Parameters**

|             |                                                                  |
|-------------|------------------------------------------------------------------|
| <i>name</i> | The name of the element to find.                                 |
| <i>nbs</i>  | The <a href="#">NBString</a> object to copy the string value to. |
|             | •                                                                |

**Returns**

Full length of the string, regardless of truncation

**16.140.2.40 FindBoolean()**

```
bool ParsedJsonDataSet::FindBoolean (
 const char * name) [inline]
```

Find the boolean value of the element after the element with the given name.

**Parameters**

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

**Return values**

|              |                                                      |
|--------------|------------------------------------------------------|
| <i>true</i>  | If the element is of the TRUE_EL primitive type.     |
| <i>false</i> | If the element is not of the TRUE_EL primitive type. |

#### 16.140.2.41 FindBooleanInCurentObject()

```
bool ParsedJsonDataSet::FindBooleanInCurentObject (
 const char * name) [inline]
```

Find the boolean value of the element within the current object. Does not search sub-objects.

##### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

##### Return values

|              |                                                      |
|--------------|------------------------------------------------------|
| <i>true</i>  | If the element is of the TRUE_EL primitive type.     |
| <i>false</i> | If the element is not of the TRUE_EL primitive type. |

#### 16.140.2.42 FindElementAfterName()

```
json_primitive_type ParsedJsonDataSet::FindElementAfterName (
 const char * name) [inline]
```

Finds name in current object points at element after name. This only supports simple, single element names. This searches from the current position to the end.

##### Parameters

|             |                       |
|-------------|-----------------------|
| <i>name</i> | The name to look for. |
|-------------|-----------------------|

##### Returns

The type that the parser is now currently set to.

##### Return values

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found. |
|-----------------|-----------------------------------------------|

#### 16.140.2.43 FindElementAfterNameInCurrentArray()

```
json_primitive_type ParsedJsonDataSet::FindElementAfterNameInCurrentArray (
 const char * name) [inline]
```

Looks for elements with the current name in the current ARRAY only. Does not search sub arrays.

##### Parameters

|             |                       |
|-------------|-----------------------|
| <i>name</i> | The name to look for. |
|-------------|-----------------------|

##### Returns

The type that the parser is now currently set to.

##### Return values

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found. |
|-----------------|-----------------------------------------------|

#### 16.140.2.44 FindElementAfterNameInCurrentObject()

```
json_primitive_type ParsedJsonDataSet::FindElementAfterNameInCurrentObject (
 const char * name) [inline]
```

Looks for elements with the current name in the current OBJECT only. Does not search sub objects.

## Parameters

|             |                       |
|-------------|-----------------------|
| <i>name</i> | The name to look for. |
|-------------|-----------------------|

## Returns

The type that the parser is now currently set to.

## Return values

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found. |
|-----------------|-----------------------------------------------|

**16.140.2.45 FindFullAtName()**

```
json_primitive_type ParsedJsonDataSet::FindFullAtName (
 const char * name) [inline]
```

Find the element in the data set with the given name and move the parser to that element. This searches a full name path, such as ob1.ob2.ob3.ob4.

## Parameters

|             |                            |
|-------------|----------------------------|
| <i>name</i> | The full name to look for. |
|-------------|----------------------------|

## Returns

The type that the parser is now currently set to.

## Return values

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found. |
|-----------------|-----------------------------------------------|

**16.140.2.46 FindFullName()**

```
json_primitive_type ParsedJsonDataSet::FindFullName (
 const char * name) [inline]
```

Find the element in the data set with the given name and move the parser to the next element. This searches a full name path, such as ob1.ob2.ob3.ob4.

## Parameters

|             |                            |
|-------------|----------------------------|
| <i>name</i> | The full name to look for. |
|-------------|----------------------------|

## Returns

The type that the parser is now currently set to.

## Return values

|                 |                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found, or there is no element after the named element. |
|-----------------|-----------------------------------------------------------------------------------------------|

**16.140.2.47 FindFullNameBoolean()**

```
bool ParsedJsonDataSet::FindFullNameBoolean (
 const char * name) [inline]
```

Find the boolean value of a given element.

## Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>name</i> | The full name of the element to find. |
|-------------|---------------------------------------|

## Return values

|              |                                                      |
|--------------|------------------------------------------------------|
| <i>true</i>  | If the element is of the TRUE_EL primitive type.     |
| <i>false</i> | If the element is not of the TRUE_EL primitive type. |

**16.140.2.48 FindFullNameNumber()**

```
double ParsedJsonDataSet::FindFullNameNumber (
 const char * name) [inline]
```

Find the number value of the element with the given name in the current object.

## Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>name</i> | The full name of the element to find. |
|             | .                                     |

## Returns

The number value of the element if found, otherwise a quiet nan.

**16.140.2.49 FindFullNamePermissiveBoolean()**

```
bool ParsedJsonDataSet::FindFullNamePermissiveBoolean (
 const char * name) [inline]
```

Find the permissive boolean value of a given element.

## Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>name</i> | The full name of the element to find. |
|-------------|---------------------------------------|

## Return values

|              |                                                                                              |
|--------------|----------------------------------------------------------------------------------------------|
| <i>true</i>  | If the current element a TRUE_EL primitive type, is "True", "true", or is a non-zero number. |
| <i>false</i> | If the current element is not a TRUE_EL primitive type, "True", "true", or is 0.             |

**16.140.2.50 FindFullNameString()**

```
const char * ParsedJsonDataSet::FindFullNameString (
 const char * name) [inline]
```

Find the string value of the element with the given name in the current object.

## Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>name</i> | The full name of the element to find. |
|             | .                                     |

## Returns

A pointer to the buffer if the string is found, or null otherwise.

### 16.140.2.51 FindGlobalBoolean()

```
bool ParsedJsonDataSet::FindGlobalBoolean (
 const char * name) [inline]
```

Find the boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.

#### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

#### Return values

|              |                                                      |
|--------------|------------------------------------------------------|
| <i>true</i>  | If the element is of the TRUE_EL primitive type.     |
| <i>false</i> | If the element is not of the TRUE_EL primitive type. |

### 16.140.2.52 FindGlobalElementAfterName()

```
json_primitive_type ParsedJsonDataSet::FindGlobalElementAfterName (
 const char * name) [inline]
```

Finds name in current object points at element after name. This only supports simple, single element names. It starts the search from the parser's current position, and if it doesn't find it, it will start the search over from the beginning.

#### Parameters

|             |                       |
|-------------|-----------------------|
| <i>name</i> | The name to look for. |
|-------------|-----------------------|

#### Returns

The type that the parser is now currently set to.

#### Return values

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>NOTFOUND</i> | If the an element with the name wasn't found. |
|-----------------|-----------------------------------------------|

### 16.140.2.53 FindGlobalNumber()

```
double ParsedJsonDataSet::FindGlobalNumber (
 const char * name) [inline]
```

Find the number value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.

#### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|             | .                                |

#### Returns

The number value of the element if found, otherwise a quiet nan.

#### 16.140.2.54 FindGlobalObject()

```
bool ParsedJsonDataSet::FindGlobalObject (
 const char * name) [inline]
```

Find the OBJECT with the given name. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.

##### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>name</i> | The name of the OBJECT to find. |
|             | .                               |

##### Return values

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| <i>true</i>  | If the OBJECT was found. The current position will be set to the start of the OBJECT. |
| <i>false</i> | If the OBJECT was not found.                                                          |

#### 16.140.2.55 FindGlobalPermissiveBoolean()

```
bool ParsedJsonDataSet::FindGlobalPermissiveBoolean (
 const char * name) [inline]
```

Find the permissive boolean value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.

##### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

##### Return values

|              |                                                                                              |
|--------------|----------------------------------------------------------------------------------------------|
| <i>true</i>  | If the current element a TRUE_EL primitive type, is "True", "true", or is a non-zero number. |
| <i>false</i> | If the current element is not a TRUE_EL primitive type, "True", "true", or is 0.             |

#### 16.140.2.56 FindGlobalString()

```
const char * ParsedJsonDataSet::FindGlobalString (
 const char * name) [inline]
```

Find the string value of a given element. Starts at the current position and then starts again at the beginning of the data set if the element isn't found. This supports only simple, single element names.

##### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

##### Returns

A pointer to the buffer if the string is found, or null otherwise.

#### 16.140.2.57 FindNumber()

```
double ParsedJsonDataSet::FindNumber (
 const char * name) [inline]
```

Find the number value of the element after the element with the given name.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

## Returns

The number value of the element if found, otherwise a quiet nan.

**16.140.2.58 FindNumberInCurentObject()**

```
double ParsedJsonDataSet::FindNumberInCurentObject (
 const char * name) [inline]
```

Find the number value of the element with the given name in the current object. Does not search sub-objects.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|             | .                                |

## Returns

The number value of the element if found, otherwise a quiet nan.

**16.140.2.59 FindObject()**

```
bool ParsedJsonDataSet::FindObject (
 const char * name) [inline]
```

Find the OBJECT of the element after the element with the given name.

## Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>name</i> | The name of the OBJECT to find. |
|-------------|---------------------------------|

## Return values

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| <i>true</i>  | If the OBJECT was found. The current position will be set to the start of the OBJECT. |
| <i>false</i> | If the OBJECT was not found.                                                          |

**16.140.2.60 FindObjectInCurentObject()**

```
bool ParsedJsonDataSet::FindObjectInCurentObject (
 const char * name) [inline]
```

Find the OBJECT of the element with the given name in the current OBJECT. Does not search sub-objects.

## Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>name</i> | The name of the OBJECT to find. |
|-------------|---------------------------------|

## Return values

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| <i>true</i>  | If the OBJECT was found. The current position will be set to the start of the OBJECT. |
| <i>false</i> | If the OBJECT was not found.                                                          |

#### 16.140.2.61 FindPermissiveBoolean()

```
bool ParsedJsonDataSet::FindPermissiveBoolean (
 const char * name) [inline]
```

Find the permissive boolean value of the element after the element with the provided name.

##### Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>name</i> | The name of element to search on. |
|-------------|-----------------------------------|

##### Return values

|              |                                                                                              |
|--------------|----------------------------------------------------------------------------------------------|
| <i>true</i>  | If the current element a TRUE_EL primitive type, is "True", "true", or is a non-zero number. |
| <i>false</i> | If the current element is not a TRUE_EL primitive type, "True", "true", or is 0.             |

#### 16.140.2.62 FindPermissiveBooleanInCurentObject()

```
bool ParsedJsonDataSet::FindPermissiveBooleanInCurentObject (
 const char * name) [inline]
```

Find the permissive boolean value of the element with the given name in the current object. Does not search sub-objects.

##### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|             | .                                |

##### Return values

|              |                                                                                              |
|--------------|----------------------------------------------------------------------------------------------|
| <i>true</i>  | If the current element a TRUE_EL primitive type, is "True", "true", or is a non-zero number. |
| <i>false</i> | If the current element is not a TRUE_EL primitive type, "True", "true", or is 0.             |

#### 16.140.2.63 FindString()

```
const char * ParsedJsonDataSet::FindString (
 const char * name) [inline]
```

Find the string value of the element after the element with the given name.

##### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|-------------|----------------------------------|

##### Returns

A pointer to the buffer if the string is found, or null otherwise.

#### 16.140.2.64 FindStringInCurentObject()

```
const char * ParsedJsonDataSet::FindStringInCurentObject (
 const char * name) [inline]
```

Find the string value of the element with the given name in the current object. Does not search sub-objects.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>name</i> | The name of the element to find. |
|             | .                                |

## Returns

A pointer to the buffer if the string is found, or null otherwise.

**16.140.2.65 GetCurrent()**

```
json_primitive_type ParsedJsonDataSet::GetCurrent () [inline]
```

Get the element at the current position of the JSON data set.

## Returns

The current element of the JSON data set.

## Return values

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>UNDEFINED</i> | If there is an error in the parsing or if the parsing is not complete. |
| <i>EOF_EL</i>    | If it's the last element in the data set.                              |

**16.140.2.66 GetFirst()**

```
json_primitive_type ParsedJsonDataSet::GetFirst () [inline]
```

Get the first element of the JSON data set.

## Returns

The first element of the JSON data set.

## Return values

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>UNDEFINED</i> | If there is an error in the parsing or if the parsing is not complete. |
| <i>EOF_EL</i>    | If it's the last element in the data set.                              |

### 16.140.2.67 GetNext()

`json_primitive_type` `ParsedJsonDataSet::GetNext ()` `[inline]`

Get the element at the next position of the JSON data set.

#### Returns

The next element of the JSON data set.

#### Return values

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>UNDEFINED</i> | If there is an error in the parsing or if the parsing is not complete. |
| <i>EOF_EL</i>    | If it's the last element in the data set.                              |

[ResetPosition\(\)](#)

[SkipCurrentValue\(\)](#)

### 16.140.2.68 GetNextArray()

`json_primitive_type` `ParsedJsonDataSet::GetNextArray ()`

Iterates the current element of the JSON data set until it finds one of type `BEGIN_ARRAY`.

#### Returns

The next element with type `BEGIN_ARRAY` after the current position.

#### Return values

|                 |                                                                             |
|-----------------|-----------------------------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no <code>BEGIN_ARRAY</code> element after the current position. |
|-----------------|-----------------------------------------------------------------------------|

#### See also

[GetNextNameInCurrentArray\(\)](#)

### 16.140.2.69 GetNextBoolInCurrentArray()

`json_primitive_type` `ParsedJsonDataSet::GetNextBoolInCurrentArray ()`

Get the next element of type `TRUE_EL` that exists in the current `ARRAY` after the current position.

#### Returns

The next element with type `TRUE_EL` in the current `ARRAY` after the current position.

#### Return values

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no <code>NAME</code> element after the current position. |
|-----------------|----------------------------------------------------------------------|

#### See also

[CurrentBool\(\)](#)

[PermissiveCurrentBool\(\)](#)

### 16.140.2.70 GetNextName()

`json_primitive_type` ParsedJsonDataSet::GetNextName () [inline]

Iterates the current element of the JSON data set until it finds one of type NAME.

#### Returns

The next element with type NAME after the current position.

#### Return values

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no NAME element after the current position. |
|-----------------|---------------------------------------------------------|

#### See also

[GetNextNameInCurrentObject\(\)](#)

[GetNextNameInCurrentArray\(\)](#)

### 16.140.2.71 GetNextNameInCurrentArray()

`json_primitive_type` ParsedJsonDataSet::GetNextNameInCurrentArray () [inline]

Get the next element of type NAME that exists in the current ARRAY after the current position.

#### Returns

The next element with type NAME in the current ARRAY after the current position.

#### Return values

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no NAME element after the current position. |
|-----------------|---------------------------------------------------------|

#### See also

[GetNextName\(\)](#)

[GetNextNameInCurrentObject\(\)](#)

### 16.140.2.72 GetNextNameInCurrentObject()

`json_primitive_type` ParsedJsonDataSet::GetNextNameInCurrentObject () [inline]

Get the next element of type NAME that exists in the current OBJECT after the current position.

#### Returns

The next element with type NAME in the current OBJECT after the current position.

#### Return values

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no NAME element after the current position. |
|-----------------|---------------------------------------------------------|

#### See also

[GetNextName\(\)](#)

[GetNextNameInCurrentArray\(\)](#)

### 16.140.2.73 GetNextNumberInCurrentArray()

`json_primitive_type` ParsedJsonDataSet::GetNextNumberInCurrentArray ()

Get the next element of type NUMBER that exists in the current ARRAY after the current position.

#### Returns

The next element with type NUMBER in the current ARRAY after the current position.

## Return values

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <b>NOTFOUND</b> | If there is no NAME element after the current position. |
|-----------------|---------------------------------------------------------|

## See also

[CurrentNumber\(\)](#)**16.140.2.74 GetNextObject()**`json_primitive_type` `ParsedJsonDataSet::GetNextObject ()`

Get the next element of type name that exists in the current OBJECT after the current position.

## Returns

The next element with type BEGIN\_OBJECT after the current position.

## Return values

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <b>NOTFOUND</b> | If there is no BEGIN_OBJECT element after the current position. |
|-----------------|-----------------------------------------------------------------|

## See also

[GetNextNameInCurrentObject\(\)](#)[GetNextNameInCurrentArray\(\)](#)**16.140.2.75 GetNextObjectInCurrentArray()**`json_primitive_type` `ParsedJsonDataSet::GetNextObjectInCurrentArray ()`

Get the next element of type BEGIN\_OBJECT that exists in the current ARRAY after the current position.

## Returns

The next element with type BEGIN\_OBJECT in the current ARRAY after the current position.

## Return values

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <b>NOTFOUND</b> | If there is no BEGIN_OBJECT element after the current position. |
|-----------------|-----------------------------------------------------------------|

## See also

[GetNextName\(\)](#)[GetNextNameInCurrentObject\(\)](#)**16.140.2.76 GetNextStringInCurrentArray()**`json_primitive_type` `ParsedJsonDataSet::GetNextStringInCurrentArray ()`

Get the next element of type STRING that exists in the current ARRAY after the current position.

## Returns

The next element with type STRING in the current ARRAY after the current position.

## Return values

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>NOTFOUND</i> | If there is no NAME element after the current position. |
|-----------------|---------------------------------------------------------|

## See also

[CurrentString\(\)](#)

**16.140.2.77 GetParsePosition()**

[JsonRef](#) ParsedJsonDataSet::GetParsePosition ()

Gets the current parse position object for the JSON data set.

## Returns

The current parse position object.

**16.140.2.78 GetPrintSize()**

```
int ParsedJsonDataSet::GetPrintSize (
 bool pretty = false) [inline]
```

Calculates how many characters the JSON data set would take to print.

## Parameters

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <i>pretty</i> | Whether indentation and new lines should be provided between elements. |
|---------------|------------------------------------------------------------------------|

## Returns

The number of characters needed to print the JSON data set.

**16.140.2.79 GetRawCurrent()**

[json\\_primitive\\_type](#) ParsedJsonDataSet::GetRawCurrent () [inline]

Get the element at the current position of the JSON data set, including non-public types.

## Returns

The current element of the JSON data set.

## Return values

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <i>UNDEFINED</i> | If there is an error in the parsing or if the parsing is not complete. |
| <i>EOF_EL</i>    | If it's the last element in the data set.                              |

### 16.140.2.80 name()

```
JsonRef ParsedJsonDataSet::name (
 const char * name) [inline]
```

Get a [JsonRef](#) representing any entity from a parent object by key name.  
Useful if more than one JSON object/element has the same name.

Example

```
JsonRef userThree = myJsonRef.name("users")[3];
```

#### Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>*name</i> | Pointer to name of the entity to find |
|--------------|---------------------------------------|

#### Returns

The reference to the entity of type [JsonRef](#)

#### See also

[ParsedJsonDataSet::operator\(\)\(\)](#), [ParsedJsonDataSet::object\(\)](#)

### 16.140.2.81 object()

```
JsonRef ParsedJsonDataSet::object (
 const char * name) [inline]
```

Get a [JsonRef](#) representing an object from a parent object by key name.

Example

```
JsonRef john = myJsonRef.object("users").object("john");
```

#### Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>*name</i> | Pointer to name of the object to find |
|--------------|---------------------------------------|

#### Returns

The reference to the object of type [JsonRef](#)

### 16.140.2.82 operator()()

```
JsonRef ParsedJsonDataSet::operator() (
 const char * name) [inline]
```

Get a [JsonRef](#) representing any entity from a parent object by key name.  
Shortcut for [JsonRef::name\(\)](#)

Example

```
JsonRef allUsers = myJsonRef("users");
```

#### Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>*name</i> | Pointer to name of the entity to find |
|--------------|---------------------------------------|

#### Returns

The reference to the entity of type [JsonRef](#)

#### See also

[ParsedJsonDataSet::name\(\)](#), [ParsedJsonDataSet::object\(\)](#)

**16.140.2.83 operator[]()**

```
JsonRef ParsedJsonDataSet::operator[] (
 int i) [inline]
```

Get a [JsonRef](#) from an array by numerical index.

**Example**

```
JsonRef userThree = myJsonRef("users")[3];
```

**Returns**

A [JsonRef](#) if array element is found

**16.140.2.84 PermissiveCurrentBool()**

```
bool ParsedJsonDataSet::PermissiveCurrentBool () [inline]
```

Returns true if the current element a TRUE\_EL primitive type, is "True", "true", or is a non-zero number.

**Return values**

|              |                                                                                              |
|--------------|----------------------------------------------------------------------------------------------|
| <i>true</i>  | If the current element a TRUE_EL primitive type, is "True", "true", or is a non-zero number. |
| <i>false</i> | If the current element does not meet the true condition..                                    |

**16.140.2.85 PrintObject()**

```
int ParsedJsonDataSet::PrintObject (
 bool pretty = false) [inline]
```

Prints the JSON data set to stdout.

**Parameters**

|               |                                                                  |
|---------------|------------------------------------------------------------------|
| <i>pretty</i> | Whether to show indentation and new lines between JSON elements. |
|---------------|------------------------------------------------------------------|

**16.140.2.86 PrintObjectToBuffer()**

```
int ParsedJsonDataSet::PrintObjectToBuffer (
 char * buffer,
 int maxlen,
 bool pretty = false) [inline]
```

Prints the JSON data set to a provided buffer.

**Parameters**

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <i>buffer</i> | The buffer to print to.                                                |
| <i>maxlen</i> | The max length of the buffer.                                          |
| <i>pretty</i> | Whether indentation and new lines should be provided between elements. |

**Returns**

The number of characters printed.

**16.140.2.87 PrintObjectToFd()**

```
int ParsedJsonDataSet::PrintObjectToFd (
 int fd,
 bool pretty = false) [inline]
```

Prints the JSON data set to a specified file descriptor.

## Parameters

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <i>fd</i>     | The file descriptor to print to.                                       |
| <i>pretty</i> | Whether indentation and new lines should be provided between elements. |

**16.140.2.88 PrintObjectToString()**

```
int ParsedJsonDataSet::PrintObjectToString (
 NBString & s,
 bool pretty = false) [inline]
```

Prints the JSON data set to a [NBString](#) object.

## Parameters

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| <i>s</i>      | The <a href="#">NBString</a> to print to.                              |
| <i>pretty</i> | Whether indentation and new lines should be provided between elements. |

**16.140.2.89 ReadFrom()**

```
virtual int ParsedJsonDataSet::ReadFrom (
 int fd) [virtual]
```

Reads in data from the specified file descriptor and parses it into the JSON data set.

## Parameters

|           |                                        |
|-----------|----------------------------------------|
| <i>fd</i> | The file descriptor to read data from. |
|-----------|----------------------------------------|

## Returns

The number of bytes read

Implements [buffer\\_object](#).

**16.140.2.90 ResetPosition()**

```
void ParsedJsonDataSet::ResetPosition () [inline]
```

Resets the parser position to the beginning of the JSON data set.

## See also

[GetFirst\(\)](#)  
[GetNext\(\)](#)  
[GetCurrent\(\)](#)  
[SkipCurrentValue\(\)](#)

**16.140.2.91 SetParsePosition()**

```
JsonRef ParsedJsonDataSet::SetParsePosition (
 JsonRef pos)
```

Sets the current parse position object for the JSON data set.

## Parameters

|            |                                                                           |
|------------|---------------------------------------------------------------------------|
| <i>pos</i> | The <a href="#">JsonRef</a> that you want to set the current position to. |
|------------|---------------------------------------------------------------------------|

## Returns

The current parse ref position for the JSON data set.

**16.140.2.92 SkipCurrentValue()**

```
json_primitive_type ParsedJsonDataSet::SkipCurrentValue () [inline]
```

Skips over the current value, and get the next element. If called inside an ARRAY or OBJECT, it will walk to the end of the ARRAY or OBJECT and return the next element it finds. If it reaches the end of the ARRAY or OBJECT before it finds a value, it will return NOTFOUND.

**Returns**

The next element.

**Return values**

|                 |                                                       |
|-----------------|-------------------------------------------------------|
| <i>NOTFOUND</i> | If there are no other elements after the current one. |
|-----------------|-------------------------------------------------------|

**See also**

[GetFirst\(\)](#)  
[GetCurrent\(\)](#)  
[GetNext\(\)](#)  
[ResetPosition\(\)](#)  
[SkipCurrentValue\(\)](#)

**16.140.2.93 WriteData()**

```
virtual int ParsedJsonDataSet::WriteData (
 const unsigned char * pCopyFrom,
 int numBytes) [virtual]
```

Writes the passed in data to the JSON data set.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <i>pCopyFrom</i> | What data to write.     |
| <i>numBytes</i>  | How many bytes to copy. |

**Returns**

The number of bytes written

Implements [buffer\\_object](#).

### 16.141.1 Detailed Description

Parsed Uniform Resource Identifier Class (URI)

Web Client HTTP functions can pass a URL, which has to be parsed and use DNS to resolve if necessary. This class provides an object with the parsed and DNS results that can be used for future transactions. The intent of using this class is to cache the parsed results and dns lookup for communication to the same resource.

Enabling WEB\_CLIENT\_SSL\_SUPPORT in [predef.h](#) adds TLS support.

The maximum size of the cached URI, path and hose are 256 bytes each.

### 16.141.2 Constructor & Destructor Documentation

#### 16.141.2.1 ParsedURI()

```
ParsedURI::ParsedURI (
 const char * uri,
 uint16_t timeout = 20 * TICKS_PER_SECOND,
 bool skipLookup = false) [inline]
```

Constructor to create a new URI object.

Parameters

|                   |                                    |
|-------------------|------------------------------------|
| <i>uri</i>        | Pointer to a URI.                  |
| <i>timeout</i>    | Number of sysem time tick to wait. |
| <i>skipLookup</i> | Skip URI lookup. Default is false. |

### 16.141.3 Member Function Documentation

#### 16.141.3.1 GetAddr()

```
IPADDR ParsedURI::GetAddr () [inline]
```

Get the resolved host Address.

Returns

The resolved host address.

**16.141.3.2 GetHost()**

```
const char * ParsedURI::GetHost () [inline]
```

Get the cached URI Host name.

**Returns**

Pointer to the cached host name if the cached URI is valid, otherwise NULL.

**16.141.3.3 GetPath()**

```
const char * ParsedURI::GetPath () [inline]
```

Get the cached URI path.

**Returns**

Pointer to the cached path string if the cached URI is valid, otherwise NULL.

**16.141.3.4 GetPort()**

```
uint16_t ParsedURI::GetPort () [inline]
```

Get the cached URI network port number.

**Returns**

The cached URI port number if the cached URI is valid, otherwise 0.

**16.141.3.5 IsSecure()**

```
bool ParsedURI::IsSecure () [inline]
```

Check the security state of the cached URI object. Requires WEB\_CLIENT\_SSL\_SUPPORT be defined in [predef.h](#).

**Return values**

|              |                        |
|--------------|------------------------|
| <i>true</i>  | Secure.                |
| <i>false</i> | URI object is invalid. |

**16.141.3.6 NewUri()**

```
void ParsedURI::NewUri (
 const char * uri,
 uint16_t timeout = 20 *TICKS_PER_SECOND,
 bool skipLookup = false)
```

Replace the existing (URI) object with new information.

Update the existing URI with a new value.

**Parameters**

|                   |                                     |
|-------------------|-------------------------------------|
| <i>uri</i>        | Pointer to a URI string.            |
| <i>timeout</i>    | Number of sysem time ticks to wait. |
| <i>skipLookup</i> | Skip URI lookup. Default is false.  |

**16.141.3.7 valid()**

```
bool ParsedURI::valid () const [inline]
```

Check to see if URI is valid.

## Return values

|              |              |
|--------------|--------------|
| <i>true</i>  | if valid     |
| <i>false</i> | if not valid |

The documentation for this class was generated from the following file:

- `http_funcs.h`

## 16.142 PartitionEntry Struct Reference

```
#include <effs_pt.h>
```

### Public Member Functions

- `uint64_t start ()`
- `uint64_t end ()`
- `uint64_t startAddr (uint32_t sectorSize)`
- `uint64_t endAddr (uint32_t sectorSize)`
- `uint64_t sectors ()`
- `uint64_t setStart (uint64_t startSector)`
- `uint64_t setSectors (uint64_t sCount)`

### Public Attributes

- `uint32_t flags: 8`  
*Any special flags for the partition.*
- `uint32_t sectorCount: 24`  
*How many sectors are in this partition.*
- `uint32_t partitionType: 8`  
*What type of filesystem is this partition.*
- `uint32_t firstSector: 24`  
*Index of first sector for this partition.*

### 16.142.1 Detailed Description

Note: `sectorCount` and `firstSector` have special meaning if the MSB is set. If MSB is set, the format is as follows:

```
realSectorCount = (2**(sectorCount[22:18]+4))*(sectorCount[17:0])
realFirstSector = (2**(firstSector[22:18]+4))*(firstSector[17:0])
```

The documentation for this struct was generated from the following file:

- `effs_pt.h`

## 16.143 PartitionTable Struct Reference

```
#include <effs_pt.h>
```

**Public Member Functions**

- uint64\_t **sectors** ()
- uint64\_t **setSectors** (uint64\_t sCount)
- uint64\_t **sectorLen** ()

**Public Attributes**

- union {
 struct {
 uint8\_t **bootExe** [422]
 *If direct execution is ever supported...*
 uint8\_t **tableLenExp**
*Table Length => 2\*\*tableLenExp: 2\*\*8 => 256 bytes.*
 uint8\_t **sectorLenExp**
*Sector Length, see Table Length.*
 uint32\_t **totalSectors**
*Total sectors available, see.*
 PartitionEntry **part** [8]
 *Partition entries.*
 uint8\_t **csums** [16]
 *Hamming code csum of 31 byte blocks comprising the Table.*
 }

 uint8\_t **pAsBytePtr** [1]
 };

**16.143.1 Detailed Description**

Note: totalSectors has special meaning if the MSB is set. If MSB is set, the format is as follows:

```
realSectorCount = (2** (sectorCount[30:27]+4)) * (sectorCount[26:0])
```

The documentation for this struct was generated from the following file:

- effs\_pt.h

**16.144 fifo\_buffer\_storage::PeekIterator Class Reference**

Iterator for non-destructive examination of buffered data.

```
#include <buffers.h>
```

**16.144.1 Detailed Description**

Iterator for non-destructive examination of buffered data.

Allows reading data from the FIFO without removing it, useful for protocol parsing and lookahead operations.

The documentation for this class was generated from the following file:

- buffers.h

**16.145 PinIO Class Reference**

GPIO Pin Class.

```

## Public Member Functions

- `PinIO ()`  
Construct an empty `PinIO`. Exists for bootstrap compatibility; not intended for general use.
- `constexpr PinIO (uint32_t port, uint32_t pin)`  
Construct a `PinIO` for a specific `cpu pin`.
- `constexpr PinIO (const PinIO &rhs)`  
Construct a copy of another `PinIO`.

- void **setFn** (pin\_fn\_t fn) const  
*Set the pin function for the managed pin(s).*
- int8\_t **getFn** ()  
*Get the pin function for the managed pin(s).*
- void **function** (pin\_fn\_t fn) const  
*Set the pin function for the managed pin(s).*
- void **hiz** () const  
*Configure the pin(s) to Input.*
- void **drive** () const  
*Configure the pin(s) to Output, without modifying the driven value.*
- void **set** () const  
*Drive the pin(s) High.*
- void **clr** () const  
*Drive the pin(s) Low.*
- bool **tgl** () const  
*Toggle the driven value for the pin(s).*
- bool **toggle** () const  
*Toggle the driven value for the pin(s).*
- bool **readBack** () const  
*Read the state of the pin(s) line state without changing the pin function or direction.*
- bool **read** () const  
*Configure the pin as an input then return the line state.*
- bool **operator=** (bool val)  
*Assign a driven value to the pin(s).*
- **PinIO** & **operator=** (const **PinIO** &rhs)  
*Assign a driven value to the pin(s) based on the line state of another pin(s).*
- **operator bool** () const  
*Read the line state of the pin(s).*
- bool **operator!** () const  
*Return the opposite of the driven value of the pin(s).*
- void **multidrv** (bool enable) const  
*Configure the multidrive/open-drain driver for the pin(s).*
- void **setHighStrength** (bool bHighDrive)  
*Configure the drive strength of the output driver for the pin(s).*
- void **setPull** (pull\_t pull)  
*Configure the pad Pull resistor for the pin(s).*
- void **PullUp** (bool enable) const  
*Configure the pad Pull Up resistor for the pin(s).*
- void **PullDown** (bool enable) const  
*Configure the pad Pull Down resistor for the pin(s).*
- uint16\_t **analogRead** () const  
*Read an analog voltage on the given Pin. Only available for pins connected to the ADC.*

## 16.145.2.4 pull\_t

enum [PinIO::pull\\_t](#)  
**pull\_t**

## 16.145.3 Constructor &amp; Destructor Documentation

## 16.145.3.1 PinIO() [1/2]

```
PinIO::PinIO (
 uint32_t port,
 uint32_t pin) [inline], [constexpr]
```

Construct a [PinIO](#) for a specific cpu pin.

## Parameters

|             |                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------|
| <i>port</i> | The zero-indexed numeric instance number of the desired Pio module. (PIOA=0, PIOB=1, PIOC=2, etc.)     |
| <i>pin</i>  | The zero-indexed pin number within the requested port that the new <a href="#">PinIO</a> is to manage. |

Example usage for pin 'PIOD\_24'

```
PinIO LED1(3, 24);
```

## 16.145.3.2 PinIO() [2/2]

```
PinIO::PinIO (
 const PinIO & rhs) [inline], [constexpr]
```

Construct a copy of another [PinIO](#).

## Parameters

|            |                                                   |
|------------|---------------------------------------------------|
| <i>rhs</i> | The <a href="#">PinIO</a> to construct a copy of. |
|------------|---------------------------------------------------|

**16.145.4 Member Function Documentation****16.145.4.1 function()**

```
void PinIO::function (
 pin_fn_t fn) const [inline]
```

Set the pin function for the managed pin(s).

## Parameters

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>fn</i> | The pin function to be assigned to the managed pin(s). |
|-----------|--------------------------------------------------------|

**16.145.4.2 getFn()**

```
int8_t PinIO::getFn () [inline]
```

Get the pin function for the managed pin(s).

## Returns

The pin function as a [pin\\_fn\\_t](#) of the managed pin(s). Returns -1 if pin is not an I/O (ex: GND, VCC)

**16.145.4.3 multidrv()**

```
void PinIO::multidrv (
 bool enable) const [inline]
```

Configure the multidrive/open-drain driver for the pin(s).

## Parameters

|               |                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------|
| <i>enable</i> | True: configure the output driver as Open Drain. False: configure the output driver as Push-Pull. |
|---------------|---------------------------------------------------------------------------------------------------|

**16.145.4.4 operator bool()**

```
PinIO::operator bool () const [inline]
```

Read the line state of the pin(s).

## Returns

The line state of the pin(s): true = High, false = Low

**16.145.4.5 operator"!()**

```
bool PinIO::operator! () const [inline]
```

Return the opposite of the *driven* value of the pin(s).

## Returns

The opposite of the *driven* value of the pin(s).

**16.145.4.6 operator=() [1/2]**

```
bool PinIO::operator= (
 bool val) [inline]
```

Assign a driven value to the pin(s).

## Parameters

|            |                                                                |
|------------|----------------------------------------------------------------|
| <i>val</i> | The value to be driven on the pin(s): true = High, false = Low |
|------------|----------------------------------------------------------------|

## Returns

The driven value for the pin(s).

**16.145.4.7 operator=()** [2/2]

```
PinIO & PinIO::operator= (
 const PinIO & rhs) [inline]
```

Assign a driven value to the pin(s) based on the line state of another pin(s).

## Parameters

|            |                                                           |
|------------|-----------------------------------------------------------|
| <i>rhs</i> | The pin(s) who's line state will be assigned to this pin. |
|------------|-----------------------------------------------------------|

## Returns

A copy of the [PinIO](#) being assigned to.

**16.145.4.8 PullDown()**

```
void PinIO::PullDown (
 bool enable) const [inline]
```

Configure the pad Pull Down resistor for the pin(s).

## Parameters

|               |                                                                   |
|---------------|-------------------------------------------------------------------|
| <i>enable</i> | True: enable the pad Pull Down. False: disable the pad Pull Down. |
|---------------|-------------------------------------------------------------------|

**16.145.4.9 PullUp()**

```
void PinIO::PullUp (
 bool enable) const [inline]
```

Configure the pad Pull Up resistor for the pin(s).

## Parameters

|               |                                                               |
|---------------|---------------------------------------------------------------|
| <i>enable</i> | True: enable the pad Pull Up. False: disable the pad Pull Up. |
|---------------|---------------------------------------------------------------|

**16.145.4.10 read()**

```
bool PinIO::read () const [inline]
```

Configure the pin as an input then return the line state.

## Returns

The line state of the pin(s).

**16.145.4.11 readBack()**

```
bool PinIO::readBack () const [inline]
```

Read the state of the pin(s) line state *without* changing the pin function or direction.

**Returns**

The line state of the pin(s).

**16.145.4.12 setFn()**

```
void PinIO::setFn (
 pin_fn_t fn) const
```

Set the pin function for the managed pin(s).

**Parameters**

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>fn</i> | The pin function to be assigned to the managed pin(s). |
|-----------|--------------------------------------------------------|

**16.145.4.13 setHighStrength()**

```
void PinIO::setHighStrength (
 bool bHighDrive) [inline]
```

Configure the drive strength of the output driver for the pin(s).

**Parameters**

|                   |                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>bHighDrive</i> | True: configure the output driver for High Drive strength. False: configure the output driver for Low Drive strength. |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|

**16.145.4.14 setPull()**

```
void PinIO::setPull (
 pull_t pull)
```

Configure the pad Pull resistor for the pin(s).

**Parameters**

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>pull</i> | direction and strength (if available) for the given pin |
|-------------|---------------------------------------------------------|

**16.145.4.15 tgl()**

```
bool PinIO::tgl () const [inline]
```

Toggle the driven value for the pin(s).

**Returns**

The previously driven value for the pin(s).

**16.145.4.16 toggle()**

```
bool PinIO::toggle () const [inline]
```

Toggle the driven value for the pin(s).

**Returns**

The previously driven value for the pin(s).

The documentation for this class was generated from the following files:

- coldfire/cpu/MCF5441X/include/cpu\_pins.h
- cortex-m7/cpu/SAME70/include/cpu\_pins.h
- cortex-m7/cpu/MIMXRT10xx/include/cpu\_pins.h

**16.146 PinIOArray2 Class Reference**

```
#include <pins.h>
```

**16.146.1 Detailed Description**

The following class is created to assist in processor pin configuration and operation for GPIO and special functions. Each pin is defined by the system in the "\nburn\<Platform>\system" and "\nburn\<Platform>\include" directories for the specific platform you are using.

Examples: P1[5] = 1; Set pin P1-5 high P2[30] = 0; Set pin P2-30 low P1[5].hiz(); Set pin P1-5 to be a high impedance input BOOL bpinstate = P2[30]; Set the pin to be an input and read if ( !P2[30] ) iprintf( "The pin is low" );

The documentation for this class was generated from the following file:

- MODM7AE70/include/pins.h

**16.147 PinIOArrayJ1 Class Reference**

```
#include <pins.h>
```

**16.147.1 Detailed Description**

The following class is created to assist in processor pin configuration and operation for GPIO and special functions. Each pin is defined by the system in the "\nburn\<Platform>\system" and "\nburn\<Platform>\include" directories for the specific platform you are using.

Examples: P1[5] = 1; Set pin P1-5 high P2[30] = 0; Set pin P2-30 low P1[5].hiz(); Set pin P1-5 to be a high impedance input BOOL bpinstate = P2[30]; Set the pin to be an input and read if ( !P2[30] ) iprintf( "The pin is low" );

The documentation for this class was generated from the following file:

- SBE70LC/include/pins.h

**16.148 PinIOJ1Array Class Reference**

```
#include <pins.h>
```

**16.148.1 Detailed Description**

The following class is created to assist in processor pin configuration and operation for GPIO and special functions. Each pin is defined by the system in the "\Nburn\<Platform>\system" and "\Nburn\<Platform>\include" directories for the specific platform you are using.

Examples: J1[5] = 1; Set pin J1-5 high J2[30] = 0; Set pin J2-30 low J1[5].hiz(); Set pin J1-5 to be a high impedance input BOOL bpinstate = J2[30]; Set the pin to be an input and read if ( !J2[30] ) iprintf( "The pin is low" );

The documentation for this class was generated from the following file:

- MOD5441X/include/pins.h

## 16.149 PinVector< n > Class Template Reference

GPIO Pin Vector Class [PinVector](#) is a template instantiation of the [\\_PinVector](#) class, allowing for minimal storage requirements for potentially large vectors, without heavy code duplication due to template copies.

```
#include <cpu_pins.h>
```

Inherits [\\_PinVector](#), and [\\_PinVector](#).

### Public Member Functions

- [PinVector](#) ()  
*Bare constructor for a [PinVector](#), where the bit configurations will be made later.*

- void [config](#) ([PinIO](#) \*pinCfgs, uint32\_t count)  
*Configure the [\\_PinVector](#) based on an array of [PinIO](#)s. The index of the [PinIO](#) in the configuration array will determine the bit position within the [\\_PinVector](#) that that [PinIO](#) represents.*
- [operator uint32\\_t](#) () const  
*Read the line state of the [\\_PinVector](#) bus.*

### 16.149.1 Detailed Description

```
template<uint8_t n>
```

```
class PinVector< n >
```

GPIO Pin Vector Class [PinVector](#) is a template instantiation of the [\\_PinVector](#) class, allowing for minimal storage requirements for potentially large vectors, without heavy code duplication due to template copies.

#### Parameters

|                                     |                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PinVector::pinStore</a> | pinStore is the actual storage allocation for large <a href="#">PinVector</a> 's <a href="#">PinIO</a> configurations. |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------|

## 16.149.2 Constructor & Destructor Documentation

### 16.149.2.1 PinVector()

```
template<uint8_t n>
PinVector< n >::PinVector (
 PinIO * initpins,
 uint32_t pinCount) [inline]
```

[PinVector](#) Constructor, where pin configurations will be made at the time of construction.

#### Parameters

|                 |                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------|
| <i>initpins</i> | The array of <a href="#">PinIO</a> s to be used to configure the <a href="#">PinVector</a> . |
| <i>pinCount</i> | The number of <a href="#">PinIO</a> s in the configuration array to be used.                 |

### 16.149.3 Member Function Documentation

#### 16.149.3.1 operator=()

```
template<uint8_t n>
uint32_t PinVector< n >::operator= (
 uint32_t val) [inline]
```

Assign a value to the [PinVector](#) Bus.

##### Parameters

|            |                                 |
|------------|---------------------------------|
| <i>val</i> | The value to assign to the bus. |
|------------|---------------------------------|

##### Returns

The value driven on the bus.

The documentation for this class was generated from the following files:

- cortex-m7/cpu/SAME70/include/cpu\_pins.h
- cortex-m7/cpu/MIMXRT10xx/include/cpu\_pins.h

## 16.150 pool\_buffer Struct Reference

Main buffer structure for network and serial communication.

```
#include <buffers.h>
```

Inherits OS\_FIFO\_EL.

##### Public Attributes

- [VPoolPtr](#) **pPoolNext**  
*Pointer to next buffer in linked list.*
- [VPoolPtr](#) **pPoolPrev**  
*Pointer to previous buffer in linked list.*
- [vuint32\\_t](#) **dwTime**  
*Timestamp or checksum storage.*
- [vuint32\\_t](#) **dwTimeFraction**  
*Fractional timestamp component.*
- [vuint16\\_t](#) **usedsize**  
*Number of bytes currently used in pData.*
- [uint8\\_t](#) **bBuffer\_state**  
*Buffer ownership state (BO\_\* values)*
- [uint8\\_t](#) **bBufferFlag**  
*Buffer state flags (BS\_\* values)*
- [uint8\\_t](#) **bUsageCount**  
*Reference count for shared buffers.*
- [uint8\\_t](#) **bInterfaceNumber**  
*Network interface number.*
- [uint8\\_t](#) **pData** [[ETHER\\_BUFFER\\_SIZE](#)]  
*Buffer data payload (1548 bytes)*

### 16.150.1 Detailed Description

Main buffer structure for network and serial communication.

The [pool\\_buffer](#) structure is the fundamental building block for all network and serial data transfers in the Net↔Burner system. Each buffer contains data payload, ownership state, and linking information for efficient memory management.

The documentation for this struct was generated from the following file:

- buffers.h

## 16.151 PsudeoHeader Struct Reference

UDP/TCP IPv4 Pseudo-header Structure (bits 0 through 95 of the pseudo-header)

```
#include <ip.h>
```

### Public Attributes

- **beuint16\_t proto**  
*Protocol number (UDP=17, TCP=6) - note: only 8 bits used, padded to 16 bits.*
- **beuint16\_t len**  
*Length of UDP/TCP header plus data (not including pseudo-header itself)*
- **IPADDR4 srcip**  
*Source IP address (same as in IP header)*
- **IPADDR4 dstip**  
*Destination IP address (same as in IP header)*

### 16.151.1 Detailed Description

UDP/TCP IPv4 Pseudo-header Structure (bits 0 through 95 of the pseudo-header)

The pseudo-header is a conceptual construct used in calculating UDP and TCP checksums. It is NOT transmitted as part of the packet, but is included in the checksum calculation to provide protection against misrouted packets.

#### WARNING:

This structure has the elements in a different order than typically defined in RFCs. The IP checksum algorithm is order-invariant on 16-bit values, so this alternate ordering allows the structure to map directly over sections of UDP and TCP packets without requiring data copying or rearrangement.

#### Warning

Do not change the field order - it is specifically designed for efficient overlay onto packet structures.

The documentation for this struct was generated from the following file:

- ip.h

## 16.152 MQTT::PublishRequest Struct Reference

Structure used to specify details for a Publish call.

```
#include <mqtt_msg_reqs.h>
```

### 16.152.1 Detailed Description

Structure used to specify details for a Publish call.

The documentation for this struct was generated from the following file:

- mqtt\_msg\_reqs.h

## 16.153 QSPI\_Record Struct Reference

This struct contains the major variables/configurations used for a QSPI transfer.

```
#include <qspi.h>
```

**Public Attributes**

- volatile uint8\_t \* **pQSPIRxbuf**  
*This pointer is used to track the locations in memory where data will be read from the peripheral.*
- volatile uint8\_t \* **pQSPITxbuf**  
*This pointer is used to track the locations in memory where data will be written to the peripheral.*
- uint8\_t **BitsPerQueue**  
*This is the number of bits per transfer, (value = 8 - 32).*
- uint32\_t **QSPI\_SizeLeft**  
*This is the number of bytes left in the transfer.*
- uint16\_t **Command\_Mask**  
*This is a partial configuration for the queue's command reg.*
- OS\_SEM \* **QSPI\_Sem**  
*This is a pointer to an external semaphore provided by [QSPIStart\(\)](#).*

**16.153.1 Detailed Description**

This struct contains the major variables/configurations used for a QSPI transfer.  
The documentation for this struct was generated from the following file:

- qspi.h

**16.154 fifo\_buffer\_storage::ReadBufPtr Class Reference**

RAII accessor for reading from buffer storage.  
#include <buffers.h>

**16.154.1 Detailed Description**

RAII accessor for reading from buffer storage.  
Provides safe access to internal buffer read pointer with automatic locking and cleanup. Not IRQ safe.  
The documentation for this class was generated from the following file:

- buffers.h

**16.155 SAI\_cfg\_t Struct Reference**

Complete configuration structure for the SAI driver.  
#include <sai.h>

**Public Attributes**

- uint32\_t txClkFreq {12288000}
- uint32\_t rxClkFreq {12288000}
- rxTxSync\_t rxTxSync {RXTX\_ASYNC}
- I2S\_Type \* sai
- SAI\_rtx\_cfg\_t rx
- SAI\_rtx\_cfg\_t tx

**16.155.1 Detailed Description**

Complete configuration structure for the SAI driver.  
This structure encapsulates all configuration parameters for both the transmit and receive channels of the SAI peripheral, along with shared parameters like clock frequencies and synchronization mode.  
Clock Configuration  
Clock frequencies determine the sample rate:

- Sample Rate = Clock Frequency / (bits per word x words per frame)
- Common audio rates: 8kHz, 16kHz, 44.1kHz, 48kHz, 96kHz

Example for 48kHz stereo 24-bit:

- Clock = 48000 x 24 x 2 = 2,304,000 Hz

#### Usage

For most applications, use one of the predefined configurations:

- SAI\_I2S\_SLAVE\_24\_TXRX\_RK: I2S slave, 24-bit, full duplex, RX clock
- SAI\_LJUST\_SLAVE\_16\_TXRX\_TK: Left-justified slave, 16-bit, TX clock

Or customize from a base configuration:

```
SAI_cfg_t myConfig = SAI_I2S_SLAVE_24_TXRX_RK;
myConfig.txClkFreq = 3072000; // Adjust clock for 16kHz sample rate
myConfig.rx.enable = false; // Transmit only
```

## 16.155.2 Member Data Documentation

### 16.155.2.1 rx

```
SAI_rxtx_cfg_t SAI_cfg_t::rx
```

Receive channel configuration

### 16.155.2.2 rxClkFreq

```
uint32_t SAI_cfg_t::rxClkFreq {12288000}
```

Receive bit clock frequency in Hz. Default: 12.288 MHz

### 16.155.2.3 rxTxSync

```
rxTxSync_t SAI_cfg_t::rxTxSync {RXTX_ASYNC}
```

Synchronization mode between RX and TX channels

### 16.155.2.4 sai

```
I2S_Type* SAI_cfg_t::sai
```

Pointer to the SAI hardware instance (SAI1, SAI2, or SAI3)

### 16.155.2.5 tx

```
SAI_rxtx_cfg_t SAI_cfg_t::tx
```

Transmit channel configuration

### 16.155.2.6 txClkFreq

```
uint32_t SAI_cfg_t::txClkFreq {12288000}
```

Transmit bit clock frequency in Hz. Must match the actual clock rate for proper operation. Default: 12.288 MHz (512 x 48kHz for 24-bit stereo)

The documentation for this struct was generated from the following file:

- [sai.h](#)

## 16.156 SAI\_rxtx\_cfg\_t Struct Reference

Configuration structure for one direction (TX or RX) of the SAI module.

```
#include <sai.h>
```

## Public Attributes

- bool `enable` {false}
- uint8\_t `startDly` {1}
- startCond\_t `startCond` {START\_FRAME\_EDGE}
- clkGate\_t `clkGate` {CLK\_GATE\_CONTINUOUS}
- clkOut\_t `clkOut` {CLK\_OUT\_CONTINUOUS}
- clkSrc\_t `clkSrc` {CLK\_SRC\_MCK}
- clkCh\_t `clkCh` {CLK\_CH\_CH}
- clkPol\_t `clkPol` {CLK\_ACTIVE\_HIGH}
- uint8\_t `syncLen` {0}
- frameEdge\_t `syncEdge` {FRAME\_SYNC\_FALLING}
- frameSyncOut\_t `syncOut` {FRAME\_SYNC\_INPUT}
- frameSyncCh\_t `syncCh` {SYNC\_CH\_CH}
- uint8\_t `wordsPerFrame` {2}
- dataPacking\_t `dataPacking` {BUFFER\_WORD32\_RIGHT}
- bool `unifyDataStream` {false}
- bitOrder\_t `bitOrder` {MOST\_SIG\_FIRST}
- bool `lineIdleState` {1}
- uint8\_t `bitsPerWord` {24}
- uint32\_t `wordMask` {0}
- bufferDepletionBehavior\_t `depletionBehavior` {DEPLETED\_PAUSE}

### 16.156.1 Detailed Description

Configuration structure for one direction (TX or RX) of the SAI module.

This structure contains all parameters needed to configure either the transmit or receive channel of the SAI peripheral. The same structure type is used for both directions, with appropriate defaults provided by predefined configurations.

Timing Configuration

The SAI operates on a frame-based model where:

- A **frame** consists of multiple words
- Each **word** consists of multiple bits
- **Frame sync** marks the start of each frame
- **Bit clock** times each bit transfer

#### Example Configuration

```
SAI_rxtx_cfg_t txConfig;
txConfig.enable = true;
txConfig.startDly = 1; // Standard I2S: 1 bit delay
txConfig.startCond = START_FRAME_EDGE;
txConfig.clkOut = CLK_OUT_INPUT; // Slave mode
txConfig.clkSrc = CLK_SRC_EXT; // External clock
txConfig.wordsPerFrame = 2; // Stereo
txConfig.bitsPerWord = 24; // 24-bit samples
txConfig.dataPacking = BUFFER_WORD32_RIGHT;
```

### 16.156.2 Member Data Documentation

#### 16.156.2.1 bitOrder

```
bitOrder_t SAI_rxtx_cfg_t::bitOrder {MOST_SIG_FIRST}
```

Bit transmission order (MSB first is standard)

#### 16.156.2.2 bitsPerWord

```
uint8_t SAI_rxtx_cfg_t::bitsPerWord {24}
```

Number of bits per word (valid audio sample size). Common values: 8, 16, 24, 32

### 16.156.2.3 clkCh

```
clkCh_t SAI_rxtx_cfg_t::clkCh {CLK_CH_CH}
```

Clock channel selection (default/RX/TX)

### 16.156.2.4 clkGate

```
clkGate_t SAI_rxtx_cfg_t::clkGate {CLK_GATE_CONTINUOUS}
```

Clock gating mode for power management

### 16.156.2.5 clkOut

```
clkOut_t SAI_rxtx_cfg_t::clkOut {CLK_OUT_CONTINUOUS}
```

Clock output mode (input/continuous output/gated output)

### 16.156.2.6 clkPol

```
clkPol_t SAI_rxtx_cfg_t::clkPol {CLK_ACTIVE_HIGH}
```

Clock polarity (active high/low)

### 16.156.2.7 clkSrc

```
clkSrc_t SAI_rxtx_cfg_t::clkSrc {CLK_SRC_MCK}
```

Clock source selection (master clock or external)

### 16.156.2.8 dataPacking

```
dataPacking_t SAI_rxtx_cfg_t::dataPacking {BUFFER_WORD32_RIGHT}
```

Buffer word format and data justification

### 16.156.2.9 depletionBehavior

```
bufferDepletionBehavior_t SAI_rxtx_cfg_t::depletionBehavior {DEPLETED_PAUSE}
```

DMA behavior when buffer queue is exhausted

### 16.156.2.10 enable

```
bool SAI_rxtx_cfg_t::enable {false}
```

Enable this channel (true = enabled, false = disabled)

### 16.156.2.11 lineIdleState

```
bool SAI_rxtx_cfg_t::lineIdleState {1}
```

Logic level to drive on data line when idle (between words).

- true: Drive high when idle
- false: Drive low when idle

### 16.156.2.12 startCond

```
startCond_t SAI_rxtx_cfg_t::startCond {START_FRAME_EDGE}
```

Starting condition that triggers data transfer

### 16.156.2.13 startDly

```
uint8_t SAI_rxtx_cfg_t::startDly {1}
```

Data delay in bit clocks from frame sync to first data bit.

- I2S standard: 1 bit delay

- Left-justified: 0 bit delay
- Right-justified: varies based on word size

#### 16.156.2.14 syncCh

```
frameSyncCh_t SAI_rxtx_cfg_t::syncCh {SYNC_CH_CH}
```

Frame sync channel selection (default/RX/TX)

#### 16.156.2.15 syncEdge

```
frameEdge_t SAI_rxtx_cfg_t::syncEdge {FRAME_SYNC_FALLING}
```

Frame sync edge defining frame boundary

#### 16.156.2.16 syncLen

```
uint8_t SAI_rxtx_cfg_t::syncLen {0}
```

Frame sync pulse width in bit clocks.

- 0: Single bit clock wide (typical for I2S)
- >0: Specified number of bit clocks

#### 16.156.2.17 syncOut

```
frameSyncOut_t SAI_rxtx_cfg_t::syncOut {FRAME_SYNC_INPUT}
```

Frame sync output mode (input/negative pulse/positive pulse)

#### 16.156.2.18 unifyDataStream

```
bool SAI_rxtx_cfg_t::unifyDataStream {false}
```

Unify data stream across multiple SAI data lines. When true, treats multiple data lines as a single stream.

#### 16.156.2.19 wordMask

```
uint32_t SAI_rxtx_cfg_t::wordMask {0}
```

Word slot mask for frames with multiple words. Each bit represents a word slot:

- 0 = word slot active (transmitted/received)
- 1 = word slot masked (skipped)

Example for stereo with left channel only: 0x00000002

#### 16.156.2.20 wordsPerFrame

```
uint8_t SAI_rxtx_cfg_t::wordsPerFrame {2}
```

Number of words contained in each frame.

- Mono: 1 word per frame
- Stereo: 2 words per frame
- Multi-channel: N words per frame

The documentation for this struct was generated from the following file:

- [sai.h](#)

## 16.157 SAICtx\_t Class Reference

Main driver class for SAI peripheral operation.

```
#include <sai.h>
```

### 16.157.1 Detailed Description

Main driver class for SAI peripheral operation.

[SAICtx\\_t](#) provides a high-level, buffer-oriented interface to the SAI peripheral. The driver manages DMA transfers, buffer chains, and provides callbacks for buffer completion events.

Driver Features

- **DMA-based transfers:** All data movement handled by eDMA for CPU efficiency
- **Buffer queuing:** Queue up to [SAI\\_TXBD\\_COUNT](#) transmit and [SAI\\_RXBD\\_COUNT](#) receive buffers
- **Circular buffering:** Automatic chaining of buffers for continuous streaming
- **Half-transfer notifications:** Optional callbacks at 50% buffer completion
- **Error handling:** Comprehensive error detection and reporting

- **Thread-safe:** Uses semaphores for safe operation from multiple tasks

#### Driver States

#### Thread Safety

The driver uses internal semaphores to synchronize buffer operations:

- Multiple tasks can queue buffers safely
- Callbacks execute in interrupt context
- Use RTOS primitives in callbacks to signal tasks

#### Performance Considerations

- Buffer size affects latency: larger buffers = more latency but less overhead
- Keep 2-3 buffers queued for gapless streaming
- Process completed buffers quickly to avoid starvation
- Use half-transfer callbacks for lower latency processing

#### Warning

Only one [SAICtx\\_t](#) instance should be used per SAI hardware peripheral. Multiple instances controlling the same hardware will conflict.

## 16.157.2 Member Enumeration Documentation

### 16.157.2.1 ctxState\_t

enum [SAICtx\\_t::ctxState\\_t](#)

Current operational state of the SAI driver.

#### Enumerator

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| CTX_STATE_STOPPED | Driver is stopped; no transfers active                  |
| CTX_STATE_INIT    | Driver initialized but no channels active               |
| CTX_STATE_TX      | Transmit channel active only                            |
| CTX_STATE_RX      | Receive channel active only                             |
| CTX_STATE_TXRX    | Both transmit and receive channels active (full duplex) |

## 16.157.3 Member Function Documentation

### 16.157.3.1 clrStickyRxError()

void [SAICtx\\_t::clrStickyRxError\(\)](#) [inline]

Clear the sticky receive error flag.

Resets the internal error flag that latches when an RX error occurs. Call this after handling an error condition to re-enable error detection.

### 16.157.3.2 clrStickyTxError()

```
void SAICtx_t::clrStickyTxError () [inline]
```

Clear the sticky transmit error flag.

Resets the internal error flag that latches when a TX error occurs. Call this after handling an error condition to re-enable error detection.

### 16.157.3.3 dump()

```
void SAICtx_t::dump ()
```

Dump driver state and statistics to the console.

Prints detailed information about the driver's current state, including:

- Configuration parameters
- DMA status
- Buffer queue status
- Error counts
- Transfer statistics

Useful for debugging and performance analysis.

```
// Dump SAI driver state
sai.dump();
```

### 16.157.3.4 getCurrentConfig()

```
int SAICtx_t::getCurrentConfig (
 SAI_cfg_t & cfg)
```

Retrieve the current active configuration.

Reads back the current hardware configuration and populates the provided configuration structure. Useful for verifying settings or creating a modified configuration based on the current state.

#### Parameters

|     |     |                                                            |
|-----|-----|------------------------------------------------------------|
| out | cfg | Configuration structure to populate with current settings. |
|-----|-----|------------------------------------------------------------|

#### Returns

0 on success

Negative on failure (driver not initialized)

```
SAI_cfg_t currentConfig;
if (sai.getCurrentConfig(currentConfig) == 0) {
 iprintf("TX Clock: %lu Hz\n", currentConfig.txClkFreq);
}
```

### 16.157.3.5 GetMaxRxBuffers()

```
int SAICtx_t::GetMaxRxBuffers () [inline]
```

Get the maximum number of receive buffers that can be queued.

#### Returns

Maximum number of RX buffers (SAI\_RXBD\_COUNT)

### 16.157.3.6 GetMaxTxBuffers()

```
int SAICtx_t::GetMaxTxBuffers () [inline]
```

Get the maximum number of transmit buffers that can be queued.

#### Returns

Maximum number of TX buffers (SAI\_TXBD\_COUNT)

**16.157.3.7 getState()**

```
ctxState_t SAICtx_t::getState () const [inline]
```

Get the current operational state of the driver.

**Returns**

Current driver state (CTX\_STATE\_STOPPED, CTX\_STATE\_INIT, etc.)

```
if (sai.getState() == SAICtx_t::CTX_STATE_TXRX) {
 iprintf("Full duplex operation active\n");
}
```

**16.157.3.8 getStickyRxError()**

```
uint8_t SAICtx_t::getStickyRxError () [inline]
```

Get the sticky receive error status.

Returns the latched error code from the most recent RX error. The value persists until cleared with [clrStickyRxError\(\)](#).

**Returns**

Error code (non-zero indicates an error occurred)

**16.157.3.9 getStickyTxError()**

```
uint8_t SAICtx_t::getStickyTxError () [inline]
```

Get the sticky transmit error status.

Returns the latched error code from the most recent TX error. The value persists until cleared with [clrStickyTxError\(\)](#).

**Returns**

Error code (non-zero indicates an error occurred)

**16.157.3.10 Init()**

```
int SAICtx_t::Init (
 const SAI_cfg_t & cfg)
```

Initialize the SAI hardware and driver context.

Configures the SAI peripheral according to the provided configuration, sets up DMA channels, and prepares the driver for buffer operations.

**Parameters**

|    |     |                                                                                                                                                     |
|----|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| in | cfg | Configuration structure specifying all SAI parameters. Use one of the predefined configurations (SAI_I2S_SLAVE_*) or create a custom configuration. |
|----|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

0 on success

Negative error code on failure:

- Configuration validation errors
- Clock initialization errors
- DMA allocation errors
- Hardware initialization errors

**Note**

Must be called before any buffer operations.

Calling [Init\(\)](#) on an already initialized driver will fail unless [Shutdown\(\)](#) is called first.

```
SAI_cfg_t config = SAI_I2S_SLAVE_24_TXRX_RK;
if (sai.Init(config) < 0) {
 iprintf("SAI initialization failed\n");
 return;
}
```

### 16.157.3.11 ReadyReceiveBuffer()

```
int SAICtx_t::ReadyReceiveBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded,
 bool enableHalfNotify = false)
```

Queue a buffer for receiving data.

Provides a buffer to the SAI driver to be filled with received data. The buffer will be added to the receive queue and automatically filled when data arrives. Up to SAI\_RXBD\_COUNT buffers can be queued simultaneously.

#### Parameters

|                         |                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>           | Pointer to the buffer to be filled with received data. <b>MUST be 32-byte aligned.</b>                            |
| <i>bufferLen</i>        | Length of the buffer in bytes. <b>MUST be a multiple of 32 bytes.</b>                                             |
| <i>waitIfNeeded</i>     | If true, blocks until space is available in the queue. If false, returns immediately with error if queue is full. |
| <i>enableHalfNotify</i> | If true, callback will be invoked at 50% buffer fill (with doneInvalid=0) in addition to full completion.         |

#### Returns

0 on success

Negative error code on failure:

- Buffer not aligned correctly
- Buffer size not valid
- Queue full (if waitIfNeeded is false)
- Driver not initialized or RX not enabled

#### Warning

The buffer must remain valid and unchanged until the completion callback indicates it is done (doneInvalid > 0).

#### Note

For continuous reception, queue the next buffer before the previous one completes to avoid losing data.

```
// Declare aligned buffer
alignas(32) uint8_t rxBuf[1024];

// Queue for reception
if (sai.ReadyReceiveBuffer(rxBuf, sizeof(rxBuf), true) < 0) {
 iprintf("Failed to queue RX buffer\n");
}
```

### 16.157.3.12 RegisterRxBufferCB()

```
void SAICtx_t::RegisterRxBufferCB (
 SAI_BufferDoneFn_t cb)
```

Register a callback for receive buffer completion.

Sets the function to be called when a receive buffer is filled or encounters an error. The callback executes in interrupt context.

#### Parameters

|           |                                                          |
|-----------|----------------------------------------------------------|
| <i>cb</i> | Callback function pointer, or NULL to disable callbacks. |
|-----------|----------------------------------------------------------|

**Note**

Only one callback can be registered at a time.

The callback executes in interrupt context - keep it brief!

```
void rxComplete(void *buffer, int status) {
 if (status > 0) {
 // Buffer filled successfully
 ProcessAudioData(buffer);
 }
}

sai.RegisterRxBufferCB(rxComplete);
```

**16.157.3.13 RegisterTxBufferCB()**

```
void SAICtx_t::RegisterTxBufferCB (
 SAI_BufferDoneFn_t cb)
```

Register a callback for transmit buffer completion.

Sets the function to be called when a transmit buffer completes or encounters an error. The callback executes in interrupt context.

**Parameters**

|           |                                                          |
|-----------|----------------------------------------------------------|
| <i>cb</i> | Callback function pointer, or NULL to disable callbacks. |
|-----------|----------------------------------------------------------|

**Note**

Only one callback can be registered at a time. Calling this function replaces any previously registered callback.

The callback executes in interrupt context - keep it brief!

```
void txComplete(void *buffer, int status) {
 if (status > 0) {
 // Buffer transmitted successfully
 OSSemPost (&txDoneSem);
 }
}

sai.RegisterTxBufferCB(txComplete);
```

**16.157.3.14 Shutdown()**

```
void SAICtx_t::Shutdown ()
```

Shut down the SAI hardware and release driver resources.

Stops all transfers, disables the SAI peripheral, releases DMA channels, and returns the driver to the stopped state.

**Warning**

Any buffers currently queued or in process will be abandoned. Ensure all important data is processed before calling [Shutdown\(\)](#).

**Note**

After shutdown, [Init\(\)](#) must be called again before using the driver.

```
sai.Shutdown();
iprintf("SAI driver stopped\n");
```

**16.157.3.15 TransmitBuffer()**

```
int SAICtx_t::TransmitBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded,
 bool enableHalfNotify = false)
```

Queue a buffer for transmission.

Hands a buffer to the SAI driver for transmission. The buffer will be added to the transmit queue and automatically transmitted when its turn comes. Up to SAI\_TXBD\_COUNT buffers can be queued simultaneously.

## Parameters

|                         |                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>           | Pointer to the buffer containing data to transmit. <b>MUST be 32-byte aligned</b> (use <code>alignas(32)</code> or <code>attribute((aligned(32)))</code> ). |
| <i>bufferLen</i>        | Length of the buffer in bytes. <b>MUST be a multiple of 32 bytes</b> . Must also align with word width (1, 2, or 4 byte multiples).                         |
| <i>waitIfNeeded</i>     | If true, blocks until space is available in the queue. If false, returns immediately with error if queue is full.                                           |
| <i>enableHalfNotify</i> | If true, callback will be invoked at 50% buffer completion (with <code>doneInvalid=0</code> ) in addition to full completion.                               |

## Returns

0 on success

Negative error code on failure:

- Buffer not aligned correctly
- Buffer size not valid
- Queue full (if `waitIfNeeded` is false)
- Driver not initialized or TX not enabled

## Warning

The buffer must remain valid and unchanged until the completion callback indicates it is done (`doneInvalid > 0`).

Do not modify the buffer contents while it is queued or being transmitted.

## Note

For continuous streaming, queue the next buffer before the previous one completes to avoid gaps in transmission.

```
// Declare aligned buffer
alignas(32) uint8_t txBuf[1024];

// Fill buffer with audio data
FillAudioBuffer(txBuf, sizeof(txBuf));

// Queue for transmission
if (sai.TransmitBuffer(txBuf, sizeof(txBuf), true) < 0) {
 iprintf("Failed to queue TX buffer\n");
}
```

## 16.158 SEMC\_cfg\_t Struct Reference

Configuration structure for SEMC (Smart External Memory Controller) interface.

```
#include <semc.h>
```

## Public Attributes

- union {  
    uint32\_t [CRO](#)  
};

*Control Register 0 - Basic Interface Configuration.*

- union {  
    uint32\_t CR1  
};

*Control Register 1 - Primary Timing Configuration.*

- union {  
    uint32\_t CR2  
};

*Control Register 2 - Extended Timing Configuration.*

- PinIO clkPin
- PinIO csPin

### 16.158.1 Detailed Description

Configuration structure for SEMC (Smart External Memory Controller) interface.

This structure configures the timing and control parameters for SEMC chip selects, supporting both synchronous and asynchronous memory devices. The SEMC interface allows connection to external SRAM, PSRAM, NOR Flash, and other parallel memory devices.

The configuration is divided into three control registers (CR0, CR1, CR2) that can be accessed either as structured bit fields or as complete 32-bit values for direct register programming.

#### Note

- All timing parameters marked as "n+1" mean the actual bus timing will be the configured value plus one clock cycle. For example, cs\_setup = 2 results in 3 clock cycles on the bus.
- Parameters marked "async mode only" are ignored in synchronous/burst mode and vice versa. Refer to the clkMode field to determine which mode is active.

---

#### Expand for Example Usage

##### Examples

##### Asynchronous SRAM Configuration (8-bit)

```
SEMC_cfg_t asyncSRAM = {};

// CR0 - Basic configuration
asyncSRAM.busWidth = SEMC_BUS_WIDTH_8BIT;
asyncSRAM.clkMode = SEMC_CLK_ASYNC;
asyncSRAM.muxMode = SEMC_MUX_A8;

// CR1 - Async timing parameters
asyncSRAM.cs_setup = 1; // 2 cycles (1+1)
asyncSRAM.cs_hold_min = 1; // 2 cycles (1+1)
asyncSRAM.addr_setup = 1; // 2 cycles (1+1)
asyncSRAM.addr_hold = 1; // 2 cycles (1+1)
asyncSRAM.wr_en_lo = 2; // 3 cycles (2+1)
asyncSRAM.wr_en_hi = 2; // 3 cycles (2+1)
asyncSRAM.rd_en_lo = 2; // 3 cycles (2+1)
asyncSRAM.rd_en_hi = 2; // 3 cycles (2+1)

// CR2 - Additional async parameters
asyncSRAM.addr_wr_hold = 1; // 2 cycles (1+1)
asyncSRAM.turnaround = 2; // 2 cycles (n, no +1)
asyncSRAM.cs_min_intv = 1; // 2 cycles (1+1)

// Pin assignments
asyncSRAM.csPin = Pins[10];
```

##### Synchronous Burst PSRAM Configuration (16-bit)

```
SEMC_cfg_t syncPSRAM = {};

// CR0 - Synchronous burst configuration
syncPSRAM.busWidth = SEMC_BUS_WIDTH_16BIT;
syncPSRAM.clkMode = SEMC_CLK_SYNC;
syncPSRAM.burstLen = SEMC_BURST_8;
syncPSRAM.muxMode = SEMC_MUX_A8;
syncPSRAM.colAddrWidth = SEMC_COL_ADDR_10BIT;

// CR1 - Basic timing
syncPSRAM.cs_setup = 0; // 1 cycle (0+1)
syncPSRAM.cs_hold_min = 0; // 1 cycle (0+1)
syncPSRAM.addr_setup = 0; // 1 cycle (0+1)
```

```

syncPSRAM.addr_hold = 1; // 1 cycle (n, no +1 in sync mode)

// CR2 - Synchronous/burst timing
syncPSRAM.wr_dat_setup = 1; // 2 cycles (1+1)
syncPSRAM.wr_dat_hold = 1; // 1 cycle (n, no +1)
syncPSRAM.latency = 3; // 3 cycle latency (n, no +1)
syncPSRAM.rd_cycle = 3; // 4 cycles (3+1)
syncPSRAM.rd_hold = 1; // 1 cycle (n, no +1)
syncPSRAM.cs_min_intv = 1; // 2 cycles (1+1)

// Pin assignments
syncPSRAM.clkPin = Pins[15];
syncPSRAM.csPin = Pins[16];

```

### Fast NOR Flash Configuration (Async Mode)

```

SEMC_cfg_t norFlash = {};

// CR0 - 16-bit async configuration
norFlash.busWidth = SEMC_BUS_WIDTH_16BIT;
norFlash.clkMode = SEMC_CLK_ASYNC;
norFlash.muxMode = SEMC_MUX_A8;

// CR1 - Fast async timing for modern NOR Flash
norFlash.cs_setup = 0; // 1 cycle (0+1)
norFlash.cs_hold_min = 0; // 1 cycle (0+1)
norFlash.addr_setup = 0; // 1 cycle (0+1)
norFlash.addr_hold = 0; // 1 cycle (0+1)
norFlash.wr_en_lo = 3; // 4 cycles (3+1)
norFlash.wr_en_hi = 3; // 4 cycles (3+1)
norFlash.rd_en_lo = 4; // 5 cycles (4+1) - longer for read
norFlash.rd_en_hi = 4; // 5 cycles (4+1)

// CR2 - Turnaround time for bus release
norFlash.addr_wr_hold = 1; // 2 cycles (1+1)
norFlash.turnaround = 3; // 3 cycles (n, no +1)
norFlash.cs_min_intv = 2; // 3 cycles (2+1)

// Pin assignment
norFlash.csPin = Pins[20];

```

### Direct Register Programming

```

SEMC_cfg_t directConfig = {};

// Set entire control registers at once
directConfig.CR0 = 0x00000091; // Pre-calculated register value
directConfig.CR1 = 0x22222222; // Pre-calculated timing
directConfig.CR2 = 0x11111111; // Pre-calculated timing

// Pin assignments
directConfig.csPin = Pins[12];

```

## 16.158.2 Member Data Documentation

### 16.158.2.1 [union]

```
union { ... } SEMC_cfg_t
```

Control Register 0 - Basic Interface Configuration.

Contains fundamental interface parameters including bus width, clock mode, burst length, multiplexing mode, and column address width. Can be accessed as individual bit fields or as a complete 32-bit register value.

### 16.158.2.2 [union]

```
union { ... } SEMC_cfg_t
```

Control Register 1 - Primary Timing Configuration.

Defines setup, hold, and enable timing for chip select, address, write enable, and read enable signals. Parameters apply differently depending on clock mode (async vs sync). Most values are "n+1" meaning actual cycles = configured + 1.

### 16.158.2.3 [union]

```
union { ... } SEMC_cfg_t
```

Control Register 2 - Extended Timing Configuration.

Contains additional timing parameters for both synchronous and asynchronous modes. Includes write data timing, latency, read cycle length, turnaround, and minimum chip select interval. Parameters are mode-specific.

**16.158.2.4 addr\_hold**

`uint32_t SEMC_cfg_t::addr_hold`

Address hold time: Async=(n+1), Sync=(n) cycles

**16.158.2.5 addr\_setup**

`uint32_t SEMC_cfg_t::addr_setup`

Address setup time before control signal (n+1 cycles)

**16.158.2.6 addr\_wr\_hold**

`uint32_t SEMC_cfg_t::addr_wr_hold`

Address to write hold time (n+1 cycles, async only)

**16.158.2.7 advHoldLvl**

`bool SEMC_cfg_t::advHoldLvl`

ADV signal hold level

**16.158.2.8 advPol**

`bool SEMC_cfg_t::advPol`

Address valid (ADV) signal polarity

**16.158.2.9 burstLen**

`SEMC_Burst_t SEMC_cfg_t::burstLen`

Burst transfer length for synchronous mode

**16.158.2.10 busWidth**

`SEMC_BusWidth_t SEMC_cfg_t::busWidth`

Data bus width (8-bit or 16-bit)

**16.158.2.11 clkMode**

`SEMC_ClkMode_t SEMC_cfg_t::clkMode`

Clock mode (asynchronous or synchronous)

**16.158.2.12 clkPin**

`PinIO SEMC_cfg_t::clkPin`

Clock output pin assignment (synchronous mode only)

**16.158.2.13 colAddrWidth**

`SEMC_ColAddrWidth_t SEMC_cfg_t::colAddrWidth`

Column address bit width (synchronous mode)

**16.158.2.14 CR0**

`uint32_t SEMC_cfg_t::CR0`

Direct access to complete Control Register 0

**16.158.2.15 CR1**

`uint32_t SEMC_cfg_t::CR1`

Direct access to complete Control Register 1

**16.158.2.16 CR2**

```
uint32_t SEMC_cfg_t::CR2
```

Direct access to complete Control Register 2

**16.158.2.17 cs\_hold\_min**

```
uint32_t SEMC_cfg_t::cs_hold_min
```

Minimum chip select hold time after cycle end (n+1 cycles)

**16.158.2.18 cs\_min\_intv**

```
uint32_t SEMC_cfg_t::cs_min_intv
```

Minimum interval between chip select assertions (n+1 cycles)

**16.158.2.19 cs\_setup**

```
uint32_t SEMC_cfg_t::cs_setup
```

Chip select setup time before address valid (n+1 cycles)

**16.158.2.20 csPin**

```
PinIO SEMC_cfg_t::csPin
```

Chip select output pin assignment

**16.158.2.21 latency**

```
uint32_t SEMC_cfg_t::latency
```

Read data latency cycles (n cycles, sync/burst only)

**16.158.2.22 muxMode**

```
SEMC_AddrMux_t SEMC_cfg_t::muxMode
```

Address/data multiplexing mode

**16.158.2.23 rd\_cycle**

```
uint32_t SEMC_cfg_t::rd_cycle
```

Total read cycle length (n+1 cycles, sync/burst only)

**16.158.2.24 rd\_en\_hi**

```
uint32_t SEMC_cfg_t::rd_en_hi
```

Read enable high period (n+1 cycles, async only)

**16.158.2.25 rd\_en\_lo**

```
uint32_t SEMC_cfg_t::rd_en_lo
```

Read enable low pulse width (n+1 cycles, async only)

**16.158.2.26 rd\_hold**

```
uint32_t SEMC_cfg_t::rd_hold
```

Read data hold time (n cycles, sync/burst only)

**16.158.2.27 RESERVED0**

```
uint8_t SEMC_cfg_t::RESERVED0
```

Reserved bits, must be 0

**16.158.2.28 RESERVED1**

```
uint8_t SEMC_cfg_t::RESERVED1
```

Reserved bit, must be 0

**16.158.2.29 turnaround**

```
uint32_t SEMC_cfg_t::turnaround
```

Bus turnaround time between transfers (n cycles, async only)

**16.158.2.30 wr\_dat\_hold**

```
uint32_t SEMC_cfg_t::wr_dat_hold
```

Write data hold time (n cycles, sync/burst only)

**16.158.2.31 wr\_dat\_setup**

```
uint32_t SEMC_cfg_t::wr_dat_setup
```

Write data setup time (n+1 cycles, sync/burst only)

**16.158.2.32 wr\_en\_hi**

```
uint32_t SEMC_cfg_t::wr_en_hi
```

Write enable high period (n+1 cycles, async only)

**16.158.2.33 wr\_en\_lo**

```
uint32_t SEMC_cfg_t::wr_en_lo
```

Write enable low pulse width (n+1 cycles, async only)

### 16.160.1 Detailed Description

Class Definition (struct is class with all members public)

### 16.160.2 Member Function Documentation

#### 16.160.2.1 AssignUartNumber()

```
void SerialRecord::AssignUartNumber (
 void)
```

Methods

Assign physical UART number to PortRecord array index member

#### 16.160.2.2 CloseListenPort()

```
void SerialRecord::CloseListenPort (
 void)
```

Close the listening port

#### 16.160.2.3 GetCurrentChannelStatus()

```
void SerialRecord::GetCurrentChannelStatus (
 char * buffer)
```

" Connected to IP xx.xx.xx.xx " Listening on port xx " UDP mode with learned send-to IP Address : xx.xx.xx.xx "  
UDP mode send to Address : xx.xx.xx.xx " Idle

#### 16.160.2.4 MakeTcpConnection()

```
void SerialRecord::MakeTcpConnection (
 void)
```

Initiate a TCP connection

#### 16.160.2.5 MakeUdpConnection()

```
void SerialRecord::MakeUdpConnection (
 void)
```

Initiate a UDP connection

#### 16.160.2.6 OkToListen()

```
bool SerialRecord::OkToListen (
 void)
```

Check if conditions are right to establish a listening port

**16.160.2.7 OpenListenPort()**

```
void SerialRecord::OpenListenPort (
 void)
```

Open the listening port

**16.160.2.8 OpenSerialPort()**

```
void SerialRecord::OpenSerialPort (
 void)
```

Open a serial port

**16.160.2.9 ProcessAccept()**

```
void SerialRecord::ProcessAccept (
 void)
```

Called when connections are waiting to be accepted

**16.160.2.10 ProcessListenError()**

```
void SerialRecord::ProcessListenError (
 void)
```

Process listening errors

**16.160.2.11 ProcessNetworkError()**

```
void SerialRecord::ProcessNetworkError (
 void)
```

Process network errors

**16.160.2.12 ProcessReadNetworkData()**

```
void SerialRecord::ProcessReadNetworkData (
 void)
```

Called when data is received on the network port side

**16.160.2.13 ProcessSerialError()**

```
void SerialRecord::ProcessSerialError (
 void)
```

Process serial errors

**16.160.2.14 ProcessSpecialFrameTCPReadSerialData()**

```
void SerialRecord::ProcessSpecialFrameTCPReadSerialData (
 void)
```

Called to initiate an outgoing TCP connection when data is received on the serial data port side (this version for TCP packet customization logic)

**16.160.2.15 ProcessSpecialFrameWriteNetworkData()**

```
void SerialRecord::ProcessSpecialFrameWriteNetworkData (
 void)
```

Called when write space has just opened up on network port (this version for TCP packet customization logic)

**16.160.2.16 ProcessSpecialFrameWriteTimeout()**

```
void SerialRecord::ProcessSpecialFrameWriteTimeout (
 void)
```

Time-out function used with TCP packet customization logic - waits for a given time to accumulate serial characters before flushing them out the network side

**16.160.2.17 ProcessTCPReadSerialData()**

```
void SerialRecord::ProcessTCPReadSerialData (
 void)
```

Called to initiate an outgoing TCP connection when data is received on the serial data port side

**16.160.2.18 ProcessTimeouts()**

```
void SerialRecord::ProcessTimeouts (
 void)
```

Test all of the communication time-outs Periodically check for live connection at a user-specified interval by sending an empty packet to the target device.

Wait at least two seconds for ACK to return after sending keep-alive packet. Target is lost if ACK was not the last packet received.

**16.160.2.19 ProcessWriteNetworkData()**

```
void SerialRecord::ProcessWriteNetworkData (
 void)
```

Called when write space has just opened up on network port

**16.160.2.20 ProcessWriteSerialData()**

```
void SerialRecord::ProcessWriteSerialData (
 void)
```

Called when write space has just opened up serial port

The documentation for this struct was generated from the following files:

- serialrecord.h
- serialrecord.cpp

**16.161 DHCP::Server Class Reference**

[DHCP Server](#) class Requires a lease allocator to be added in order to function.

```
#include <dhcpcd.h>
```

**16.161.1 Detailed Description**

[DHCP Server](#) class Requires a lease allocator to be added in order to function.

The documentation for this class was generated from the following file:

- dhcpcd.h

**16.162 SimpleBufferObject Class Reference**

Class for web client response buffers.

```
#include <web_buffers.h>
```

Inherits [buffer\\_object](#).

**16.162.1 Detailed Description**

Class for web client response buffers.

The documentation for this class was generated from the following file:

- web\_buffers.h

## 16.163 DHCP::SingleAllocator Class Reference

Stripped down allocator Fails to conform to many standard behaviors, but shows the basics of what needs to be implemented.

```
#include <dhcpd.h>
```

Inherits [DHCP::LeaseAllocator](#).

### 16.163.1 Detailed Description

Stripped down allocator Fails to conform to many standard behaviors, but shows the basics of what needs to be implemented.

The documentation for this class was generated from the following file:

- `dhcpd.h`

## 16.164 SMPoolPtr Class Reference

Smart pointer wrapper for automatic buffer management.

```
#include <buffers.h>
```

### Public Member Functions

- **SMPoolPtr** ()  
*Constructor - automatically allocates a buffer.*
- **SMPoolPtr** (const [PoolPtr](#) pp)  
*Constructor from existing buffer pointer.*
- **~SMPoolPtr** ()  
*Destructor - automatically frees the buffer.*

### 16.164.1 Detailed Description

Smart pointer wrapper for automatic buffer management.

RAII wrapper that automatically allocates a buffer on construction and frees it on destruction. Helps prevent buffer leaks in exception-safe code.

### 16.164.2 Constructor & Destructor Documentation

#### 16.164.2.1 SMPoolPtr()

```
SMPoolPtr::SMPoolPtr (
 const PoolPtr pp) [inline]
```

Constructor from existing buffer pointer.

#### Parameters

|           |                  |
|-----------|------------------|
| <i>pp</i> | Buffer to manage |
|-----------|------------------|

The documentation for this class was generated from the following file:

### 16.165.1 Detailed Description

The Single-Bit SPI mode QSPI Peripheral Class.

Class definition for SPI module objects

### 16.165.2 Constructor & Destructor Documentation

#### 16.165.2.1 **SPI\_QSPI()** [1/2]

```
SPI_QSPI::SPI_QSPI (
 uint8_t QuadSPIModule = DEFAULT_QUADSPI_MODULE)
```

Create a SPI object.

This constructor will create the object, but will *not* initialize the SPI module. You must call the **Init()** member function to initialize.

#### Parameters

|                      |                                                                 |
|----------------------|-----------------------------------------------------------------|
| <b>QuadSPIModule</b> | QSPI module number (0). The SAME70 only has one QuadSPI module. |
|----------------------|-----------------------------------------------------------------|

#### 16.165.2.2 **SPI\_QSPI()** [2/2]

```
SPI_QSPI::SPI_QSPI (
 uint8_t QuadSPIModule,
 uint32_t baudRateInBps,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
```

```
uint8_t csToClockDelay = 0,
uint8_t delayAfterTransfer = 0)
```

Create a SPI object and Initialize with parameters.

Creates a SPI object and initializes the SPI module. You do not need to call the [Init\(\)](#) member function.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned

#### Parameters

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>QuadSPIModule</i>         | QSPI module number (0). The SAME70 has only one QuadSPI module                                                              |
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8-bit up to 16-bit transfer sizes are valid                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer. Only one chip select is available to the QuadSPI peripheral on pin P2[48].            |
| <i>chipSelectPolarity</i>    | Parameter not supported on the MODM7AE70. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>   |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | Delay from chip select to valid clock (default is 0). When 0, the delay is half the clock period.                           |
| <i>delayAfterTransfer</i>    | When 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. |

## 16.165.3 Member Function Documentation

### 16.165.3.1 Init()

```
virtual uint8_t SPI_QSPI::Init (
 uint32_t baudRateInBps = 2000000,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0) [override], [virtual]
```

Initialize an existing SPI object.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned

#### Parameters

|                              |                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                               |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8-bit up to 16-bit transfer sizes are valid                                                  |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer. Only one chip select is available to the QuadSPI peripheral on pin P2[48].          |
| <i>chipSelectPolarity</i>    | Parameter not supported on the MODM7AE70. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a> |

## Parameters

|                           |                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>clockPolarity</i>      | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>         | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>            | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>     | Delay from chip select to valid clock (default is 0). When 0, the delay is half the clock period.                           |
| <i>delayAfterTransfer</i> | When 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. |

## Returns

The current state of the SPI bus [dspState](#)

Reimplemented from [SPIModule](#).

**16.165.3.2 Rx()**

```
uint8_t SPI_QSPI::Rx (
 uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional receive.

## Parameters

|                           |                                                  |
|---------------------------|--------------------------------------------------|
| <i>receiveBufferPtr</i>   | Pointer to the buffer to write the received data |
| <i>byteCount</i>          | Number of bytes to transmit                      |
| <i>csReturnToInactive</i> | Chip select state                                |

## Returns

The current state of the SPI bus [dspState](#)

Reimplemented from [SPIModule](#).

**16.165.3.3 SetBusSpeed()**

```
virtual uint32_t SPI_QSPI::SetBusSpeed (
 uint32_t maxSpeed) [override], [virtual]
```

Set the SPI bus speed Will attempt to set the desired bus speed. It may be different based on the available system characteristics.

## Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>maxSpeed</i> | The maximum desired bus speed |
|-----------------|-------------------------------|

## Returns

The actual bus speed

Reimplemented from [SPIModule](#).

**16.165.3.4 SetCS()**

```
virtual bool SPI_QSPI::SetCS (
 uint8_t CS) [inline], [override], [virtual]
```

Set the chip select configuration for the SPI object's bus transactions.

Single-bit SPI mode for the QuadSPI peripheral only supports one chip select. This function is defined for compatibility between SPI drivers.

## Parameters

|    |                                              |
|----|----------------------------------------------|
| CS | The QuadSPI module has only one chip select. |
|----|----------------------------------------------|

## Returns

true if successful, false if SPI is currently active

Reimplemented from [SPIModule](#).

**16.165.3.5 Start()**

```
virtual uint8_t SPI_QSPI::Start (
 uint8_t * transmitBufferPtr,
 volatile uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [override], [virtual]
```

Start a SPI transfer.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned
- If either RX or TX pointer is assigned 'null' then that communication direction will not occur.

## Parameters

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>receiveBufferPtr</i>   | Pointer to the buffer to store the received data      |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state <a href="#">dspIChipSelectMode</a>  |

## Returns

The current state of the SPI bus [dspIState](#)

Reimplemented from [SPIModule](#).

**16.165.3.6 Tx()**

```
virtual uint8_t SPI_QSPI::Tx (
 uint8_t * transmitBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [override], [virtual]
```

Convenience function for unidirectional transmit.

## Parameters

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

## Returns

The current state of the SPI bus [dspIState](#)

Reimplemented from [SPIModule](#).

The documentation for this class was generated from the following file:

- quadspi.h

### 16.166.1 Detailed Description

USART in SPI mode Peripheral Module Class.

Class definition for SPI module objects

### 16.166.2 Constructor & Destructor Documentation

#### 16.166.2.1 [SPI\\_USART\(\)](#) [1/2]

```
SPI_USART::SPI_USART (
 uint8_t USARTModule)
```

Create a SPI object.

This constructor will create the object, but will *not* initialize the SPI module. You must call the [Init\(\)](#) member function to initialize.

#### Parameters

|                    |                            |
|--------------------|----------------------------|
| <i>USARTModule</i> | SPI module number (0 or 1) |
|--------------------|----------------------------|

### 16.166.2.2 SPI\_USART() [2/2]

```
SPI_USART::SPI_USART (
 uint8_t USARTModule,
 uint32_t baudRateInBps,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0)
```

Create a SPI object and Initialize with parameters.

Creates a SPI object and initializes the SPI module. You do not need to call the [Init\(\)](#) member function.

#### Parameters

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>USARTModule</i>           | USART module number (0 or 1)                                                                                                |
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer                                                                                        |
| <i>chipSelectPolarity</i>    | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | This option is not supported by the USART peripheral in SPI mode.                                                           |
| <i>delayAfterTransfer</i>    | This option is not supported by the USART peripheral in SPI mode.                                                           |

## 16.166.3 Member Function Documentation

### 16.166.3.1 Init()

```
virtual uint8_t SPI_USART::Init (
 uint32_t baudRateInBps = 2000000,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0) [override], [virtual]
```

Initialize an existing SPI object.

#### Parameters

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer                                                                                        |
| <i>chipSelectPolarity</i>    | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |

## Parameters

|                           |                                                                   |
|---------------------------|-------------------------------------------------------------------|
| <i>doutHiz</i>            | Data output high impedance between transfers                      |
| <i>csToClockDelay</i>     | This option is not supported by the USART peripheral in SPI mode. |
| <i>delayAfterTransfer</i> | This option is not supported by the USART peripheral in SPI mode. |

## Returns

The current state of the SPI bus [dsSpiState](#)

Reimplemented from [SPIModule](#).

**16.166.3.2 Rx()**

```
uint8_t SPI_USART::Rx (
 uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional receive.

## Parameters

|                           |                                                  |
|---------------------------|--------------------------------------------------|
| <i>receiveBufferPtr</i>   | Pointer to the buffer to write the received data |
| <i>byteCount</i>          | Number of bytes to transmit                      |
| <i>csReturnToInactive</i> | Chip select state                                |

## Returns

The current state of the SPI bus [dsSpiState](#)

Reimplemented from [SPIModule](#).

**16.166.3.3 SetBusSpeed()**

```
virtual uint32_t SPI_USART::SetBusSpeed (
 uint32_t maxSpeed) [override], [virtual]
```

Set the SPI bus speed Will attempt to set the desired bus speed. It may be different based on the available system characteristics.

## Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>maxSpeed</i> | The maximum desired bus speed |
|-----------------|-------------------------------|

## Returns

The actual bus speed

Reimplemented from [SPIModule](#).

**16.166.3.4 SetCS()**

```
virtual bool SPI_USART::SetCS (
 uint8_t CS) [inline], [override], [virtual]
```

Set the chip select configuration for the SPI object's bus transactions.

## Parameters

|           |                            |
|-----------|----------------------------|
| <i>CS</i> | Chip select to set, 0 - 3. |
|-----------|----------------------------|

**Returns**

true if successful, false if SPI is currently active

Reimplemented from [SPIModule](#).

**16.166.3.5 Start()**

```
virtual uint8_t SPI_USART::Start (
 uint8_t * transmitBufferPtr,
 volatile uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [override], [virtual]
```

Start a SPI transfer.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned
- If configured for > than 16 bits per transfer then the data must be uint32\_t aligned
- If either RX or TX pointer is assigned 'null' then that communication direction will not occur.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>receiveBufferPtr</i>   | Pointer to the buffer to store the received data      |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspState](#)

Reimplemented from [SPIModule](#).

**16.166.3.6 Tx()**

```
virtual uint8_t SPI_USART::Tx (
 uint8_t * transmitBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [override], [virtual]
```

Convenience function for unidirectional transmit.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspState](#)

Reimplemented from [SPIModule](#).

The documentation for this class was generated from the following file:

- usart.h

## 16.167 spiDriverStruct Struct Reference

Variables/configurations for a DSPI transfer.

```
#include <dspi.h>
```

### Public Attributes

- [csReturnType](#) **csReturnToInactive**  
*The chip select assertion configuration.*
- volatile uint8\_t **SPI\_INT\_STATUS**  
*Status of the spi device.*
- volatile BOOL **SPIfinished**
  
- volatile uint8\_t \* **pRxBuf**  
*Pointer to memory where data will be read from the peripheral.*
- volatile uint8\_t \* **pTxBuf**  
*Pointer to memory where data will be written to the peripheral.*
- uint8\_t **BitsPerQueue**  
*The number of bits per transfer, (value = 8 - 32)*
- bool **isByteSwap**
  
- uint32\_t **SPI\_SizeLeft**  
*The number of bytes left in the transfer.*
- uint16\_t **Command\_Mask**  
*A partial configuration for the queue's command reg.*
- OS\_SEM \* **SPI\_Sem**  
*A pointer to an external semaphore provided by [DSPIStart\(\)](#)*
- uint32\_t **WordsToWrite**  
*Number of words to write to the command/TX Queues and Read from RX.*
- uint32\_t **LastWordsToWrite**  
*The amount from the previous ISR.*
- volatile [dspiDMAStruct](#) **dma**

### 16.167.1 Detailed Description

Variables/configurations for a DSPI transfer.

## 16.168.1 Detailed Description

SPI Peripheral Module Class.

Class definition for SPI module objects

## 16.168.2 Constructor & Destructor Documentation

### 16.168.2.1 SPIModule() [1/5]

```
SPIModule::SPIModule (
 uint8_t SPIModule)
```

Create a SPI object.

This constructor will create the object, but will *not* initialize the SPI module. You must call the [Init\(\)](#) member function to initialize.

#### Parameters

|                           |                            |
|---------------------------|----------------------------|
| <a href="#">SPIModule</a> | SPI module number (0 or 1) |
|---------------------------|----------------------------|

**16.168.2.2 SPIModule() [2/5]**

```

SPIModule::SPIModule (
 uint8_t SPIModule,
 uint32_t baudRateInBps,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0,
 uint8_t delayBetweenTransfer = 0)

```

Create a SPI object and Initialize with parameters.

Creates a SPI object and initializes the SPI module. You do not need to call the [Init\(\)](#) member function.

**Parameters**

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SPIModule</a>    | SPI module number (0 or 1)                                                                                                  |
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer <a href="#">spiChipSelect</a>                                                          |
| <i>chipSelectPolarity</i>    | Parameter not supported on the MODM7AE70. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>   |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | Delay from chip select to valid clock (default is 0)                                                                        |
| <i>delayAfterTransfer</i>    | Chip select mode <a href="#">dsPICChipSelectMode</a>                                                                        |
| <i>delayBetweenTransfer</i>  | Min Delay between transfers                                                                                                 |

**16.168.2.3 SPIModule() [3/5]**

```

SPIModule::SPIModule (
 uint8_t SPIModule)

```

Create a SPI object.

This constructor will create the object, but will *not* initialize the SPI module. You must call the [Init\(\)](#) member function to initialize.

**Parameters**

|                           |                   |
|---------------------------|-------------------|
| <a href="#">SPIModule</a> | SPI module number |
|---------------------------|-------------------|

**16.168.2.4 SPIModule() [4/5]**

```

SPIModule::SPIModule (
 uint8_t SPIModule,
 uint32_t baudRateInBps,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,

```

```

 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0)

```

Create a SPI object and Initialize with parameters.

Creates a SPI object and initializes the SPI module. You do not need to call the [Init\(\)](#) member function.

#### Parameters

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SPIModule</a>    | SPI module number (0 or 1)                                                                                                  |
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer <a href="#">spiChipSelect</a>                                                          |
| <i>chipSelectPolarity</i>    | Parameter not supported on the SOMRT1061. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>   |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | Delay from chip select to valid clock (default is 0)                                                                        |
| <i>delayAfterTransfer</i>    | Chip select mode <a href="#">dspChipSelectMode</a>                                                                          |

#### 16.168.2.5 SPIModule() [5/5]

```

SPIModule::SPIModule (
 uint8_t SPIModule,
 uint32_t baudRateInBps,
 uint8_t transferSizeInBits = 8,
 PinIO gpioChipSelect = PinDef_INVALID,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0)

```

Create a SPI object and Initialize with parameters.

Creates a SPI object and initializes the SPI module. You do not need to call the [Init\(\)](#) member function.

#### Parameters

|                           |                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SPIModule</a> | SPI module number (0 or 1)                                                                                                                                                                 |
| <i>baudRateInBps</i>      | Maximum baud rate requested                                                                                                                                                                |
| <i>transferSizeInBits</i> | Number of bits per transfer: 8, 16 or 32                                                                                                                                                   |
| <i>gpioChipSelect</i>     | <a href="#">PinIO</a> to be configured as GPIO and used as chip select. Only supports <a href="#">spiDriverStruct::csReturnToInactive</a> values of DEASSERT_AFTER_LAST and DEASSERT_NEVER |
| <i>chipSelectPolarity</i> | Parameter not supported on the SOMRT1061. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>                                                                  |
| <i>clockPolarity</i>      | 0 = inactive logic level low, 1 = high                                                                                                                                                     |
| <i>clockPhase</i>         | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge.                                                                |
| <i>doutHiz</i>            | Data output high impedance between transfers                                                                                                                                               |
| <i>csToClockDelay</i>     | Delay from chip select to valid clock (default is 0)                                                                                                                                       |
| <i>delayAfterTransfer</i> | Chip select mode <a href="#">dspChipSelectMode</a>                                                                                                                                         |

### 16.168.3 Member Function Documentation

#### 16.168.3.1 ClrSem() [1/2]

```
virtual bool SPIModule::ClrSem () [inline], [virtual]
```

Clear a semaphore registration.

##### Returns

true if the clear was successful, false if a SPI transaction is in progress

#### 16.168.3.2 ClrSem() [2/2]

```
virtual bool SPIModule::ClrSem () [inline], [virtual]
```

Clear a semaphore registration.

##### Returns

true if the clear was successful, false if a SPI transaction is in progress

#### 16.168.3.3 Done() [1/4]

```
virtual bool SPIModule::Done () [inline], [virtual]
```

Function to check SPI status.

Called as a class method on a specific SPI object. For example: MySpi.Done()

##### Returns

true if SPI is finished, false if active

#### 16.168.3.4 Done() [2/4]

```
virtual bool SPIModule::Done () [inline], [virtual]
```

Function to check SPI status.

Called as a class method on a specific SPI object. For example: MySpi.Done()

##### Returns

true if SPI is finished, false if active

#### 16.168.3.5 Done() [3/4]

```
static BOOL SPIModule::Done (
 uint8_t SPIModule) [static]
```

Static function to check SPI status.

Is called as a class wide static method. For example: SPIModule::Done(0)

##### Parameters

|                  |                                    |
|------------------|------------------------------------|
| <i>SPIModule</i> | The SPI module to check, 0, 1 or 2 |
|------------------|------------------------------------|

##### Returns

true if SPI is finished, false if active

#### 16.168.3.6 Done() [4/4]

```
static BOOL SPIModule::Done (
 uint8_t SPIModule) [static]
```

Static function to check SPI status.

Is called as a class wide static method. For example: SPIModule::Done(0)

## Parameters

|                                  |                                    |
|----------------------------------|------------------------------------|
| <a href="#"><i>SPIModule</i></a> | The SPI module to check, 0, 1 or 2 |
|----------------------------------|------------------------------------|

## Returns

true if SPI is finished, false if active

**16.168.3.7 GetActualBaudrate()** [1/2]

```
virtual uint32_t SPIModule::GetActualBaudrate () [inline], [virtual]
```

Returns the active baud rate.

The baud rate will be set to the value specified when the SPI module is initialized. If that value is not possible, the next lowest baud rate will be chosen.

## Returns

The actual SPI module baud rate

**16.168.3.8 GetActualBaudrate()** [2/2]

```
virtual uint32_t SPIModule::GetActualBaudrate () [inline], [virtual]
```

Returns the active baud rate.

The baud rate will be set to the value specified when the SPI module is initialized. If that value is not possible, the next lowest baud rate will be chosen.

## Returns

The actual SPI module baud rate

**16.168.3.9 GetSem()** [1/2]

```
virtual OS_SEM * SPIModule::GetSem () [inline], [virtual]
```

Obtain a pointer to the SPI finished semaphore.

## Returns

A pointer to the semaphore

**16.168.3.10 GetSem()** [2/2]

```
virtual OS_SEM * SPIModule::GetSem () [inline], [virtual]
```

Obtain a pointer to the SPI finished semaphore.

## Returns

A pointer to the semaphore

**16.168.3.11 Init()** [1/3]

```
virtual uint8_t SPIModule::Init (
 uint32_t baudRateInBps = 2000000,
 uint8_t transferSizeInBits = 8,
 PinIO gpioChipSelect = PinDef_INVALID,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0) [virtual]
```

Initialize an existing SPI object.

## Parameters

|                           |                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>baudRateInBps</i>      | Maximum baud rate requested                                                                                                                                                                |
| <i>transferSizeInBits</i> | Number of bits per transfer: 8, 16 or 32                                                                                                                                                   |
| <i>gpioChipSelect</i>     | <a href="#">PinIO</a> to be configured as GPIO and used as chip select. Only supports <a href="#">spiDriverStruct::csReturnToInactive</a> values of DEASSERT_AFTER_LAST and DEASSERT_NEVER |
| <i>chipSelectPolarity</i> | Parameter not supported on the SOMRT1061. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>                                                                  |
| <i>clockPolarity</i>      | 0 = inactive logic level low, 1 = high                                                                                                                                                     |
| <i>clockPhase</i>         | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge.                                                                |
| <i>doutHiz</i>            | Data output high impedance between transfers                                                                                                                                               |
| <i>csToClockDelay</i>     | Delay from chip select to valid clock (default is 0)                                                                                                                                       |
| <i>delayAfterTransfer</i> | Chip select mode <a href="#">dspciChipSelectMode</a>                                                                                                                                       |

## Returns

The current state of the SPI bus [dspciState](#)

**16.168.3.12 Init() [2/3]**

```
virtual uint8_t SPIModule::Init (
 uint32_t baudRateInBps = 2000000,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0) [virtual]
```

Initialize an existing SPI object.

## Parameters

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer <a href="#">spiChipSelect</a>                                                          |
| <i>chipSelectPolarity</i>    | Parameter not supported on the SOMRT1061. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>   |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | Delay from chip select to valid clock (default is 0)                                                                        |
| <i>delayAfterTransfer</i>    | Chip select mode <a href="#">dspciChipSelectMode</a>                                                                        |

## Returns

The current state of the SPI bus [dspciState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.13 Init() [3/3]**

```
virtual uint8_t SPIModule::Init (
 uint32_t baudRateInBps = 2000000,
 uint8_t transferSizeInBits = 8,
 uint8_t peripheralChipSelects = 0x00,
 uint8_t chipSelectPolarity = 0x0F,
 uint8_t clockPolarity = 0,
 uint8_t clockPhase = 1,
 BOOL doutHiz = TRUE,
 uint8_t csToClockDelay = 0,
 uint8_t delayAfterTransfer = 0) [virtual]
```

Initialize an existing SPI object.

**Parameters**

|                              |                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>baudRateInBps</i>         | Maximum baud rate requested                                                                                                 |
| <i>transferSizeInBits</i>    | Number of bits per transfer: 8, 16 or 32                                                                                    |
| <i>peripheralChipSelects</i> | SPI chip selects to use for transfer <a href="#">spiChipSelect</a>                                                          |
| <i>chipSelectPolarity</i>    | Parameter not supported on the MODM7AE70. Chip select asserts with logic level low. <a href="#">spiChipSelectPolarity</a>   |
| <i>clockPolarity</i>         | 0 = inactive logic level low, 1 = high                                                                                      |
| <i>clockPhase</i>            | 0 = data captured leading edge clock, changed following edge. 1 = data changed leading edge clock, captured following edge. |
| <i>doutHiz</i>               | Data output high impedance between transfers                                                                                |
| <i>csToClockDelay</i>        | Delay from chip select to valid clock (default is 0)                                                                        |
| <i>delayAfterTransfer</i>    | Chip select mode <a href="#">dspChipSelectMode</a>                                                                          |

**Returns**

The current state of the SPI bus [dspState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.14 RegisterSem() [1/2]**

```
virtual bool SPIModule::RegisterSem (
 OS_SEM * finishedSem) [virtual]
```

Register a semaphore for the SPI module.

The SPI module will post to this semaphore when a transaction is complete

**Parameters**

|                    |                          |
|--------------------|--------------------------|
| <i>finishedSem</i> | Pointer to the semaphore |
|--------------------|--------------------------|

**Returns**

true if the registration was successful, false if a SPI transaction is in progress

**16.168.3.15 RegisterSem() [2/2]**

```
virtual bool SPIModule::RegisterSem (
 OS_SEM * finishedSem) [virtual]
```

Register a semaphore for the SPI module.

The SPI module will post to this semaphore when a transaction is complete

## Parameters

|                    |                          |
|--------------------|--------------------------|
| <i>finishedSem</i> | Pointer to the semaphore |
|--------------------|--------------------------|

## Returns

true if the registration was successful, false if a SPI transaction is in progress

**16.168.3.16 Rx()** [1/2]

```
virtual uint8_t SPIModule::Rx (
 uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional receive.

## Parameters

|                           |                                              |
|---------------------------|----------------------------------------------|
| <i>*receiveBufferPtr</i>  | Pointer to the buffer to store incoming data |
| <i>byteCount</i>          | Number of bytes to transmit                  |
| <i>csReturnToInactive</i> | Chip select state                            |

## Returns

The current state of the SPI bus [dspState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.17 Rx()** [2/2]

```
virtual uint8_t SPIModule::Rx (
 uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional receive.

## Parameters

|                           |                                              |
|---------------------------|----------------------------------------------|
| <i>*receiveBufferPtr</i>  | Pointer to the buffer to store incoming data |
| <i>byteCount</i>          | Number of bytes to transmit                  |
| <i>csReturnToInactive</i> | Chip select state                            |

## Returns

The current state of the SPI bus [dspState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.18 SetBusSpeed()** [1/2]

```
virtual uint32_t SPIModule::SetBusSpeed (
 uint32_t maxSpeed) [virtual]
```

Set the SPI bus speed Will attempt to set the desired bus speed. It may be different based on the available system characteristics.

## Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>maxSpeed</i> | The maximum desired bus speed |
|-----------------|-------------------------------|

**Returns**

The actual bus speed

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.19 SetBusSpeed() [2/2]**

```
virtual uint32_t SPIModule::SetBusSpeed (
 uint32_t maxSpeed) [virtual]
```

Set the SPI bus speed Will attempt to set the desired bus speed. It may be different based on the available system characteristics.

**Parameters**

|                 |                               |
|-----------------|-------------------------------|
| <i>maxSpeed</i> | The maximum desired bus speed |
|-----------------|-------------------------------|

**Returns**

The actual bus speed

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.20 SetCS() [1/2]**

```
virtual bool SPIModule::SetCS (
 uint8_t CS) [inline], [virtual]
```

Set the chip select configuration for the SPI object's bus transactions.  
If an invalid CS number is given, a default chip select of 0 is used.

**Parameters**

|           |                            |
|-----------|----------------------------|
| <i>CS</i> | Chip select to set, 0 - 3. |
|-----------|----------------------------|

**Returns**

true if successful, false if SPI is currently active

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.21 SetCS() [2/2]**

```
virtual bool SPIModule::SetCS (
 uint8_t CS) [inline], [virtual]
```

Set the chip select configuration for the SPI object's bus transactions.

**Parameters**

|           |                            |
|-----------|----------------------------|
| <i>CS</i> | Chip select to set, 0 - 3. |
|-----------|----------------------------|

**Returns**

true if successful, false if SPI is currently active

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.22 Start()** [1/2]

```
virtual uint8_t SPIModule::Start (
 uint8_t * transmitBufferPtr,
 volatile uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [virtual]
```

Start a SPI transfer.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned
- If configured for > than 16 bits per transfer then the data must be uint32\_t aligned
- If either RX or TX pointer is assigned 'null' then that communication direction will not occur.
- If DSPI\_Finished points to a semaphore, then the DSPI will POST to it when the transfer is complete.
- The semaphore is optional, but it can increase efficiency.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>receiveBufferPtr</i>   | Pointer to the buffer to store the received data      |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspiState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.23 Start()** [2/2]

```
virtual uint8_t SPIModule::Start (
 uint8_t * transmitBufferPtr,
 volatile uint8_t * receiveBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [virtual]
```

Start a SPI transfer.

- If configured for 8 bits per transfer then the data must be uint8\_t aligned
- If configured for > than 8 bits per transfer then the data must be uint16\_t aligned
- If configured for > than 16 bits per transfer then the data must be uint32\_t aligned
- If either RX or TX pointer is assigned 'null' then that communication direction will not occur.
- If DSPI\_Finished points to a semaphore, then the DSPI will POST to it when the transfer is complete.
- The semaphore is optional, but it can increase efficiency.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>transmitBufferPtr</i>  | Pointer to the buffer containing the data to transmit |
| <i>receiveBufferPtr</i>   | Pointer to the buffer to store the received data      |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspiState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.24 Tx() [1/2]**

```
virtual uint8_t SPIModule::Tx (
 uint8_t * transmitBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional transmit.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>*transmitBufferPtr</i> | Pointer to the buffer containing the data to transmit |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspiState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

**16.168.3.25 Tx() [2/2]**

```
virtual uint8_t SPIModule::Tx (
 uint8_t * transmitBufferPtr,
 uint32_t byteCount,
 int csReturnToInactive = DEASSERT_AFTER_LAST) [inline], [virtual]
```

Convenience function for unidirectional transmit.

**Parameters**

|                           |                                                       |
|---------------------------|-------------------------------------------------------|
| <i>*transmitBufferPtr</i> | Pointer to the buffer containing the data to transmit |
| <i>byteCount</i>          | Number of bytes to transmit                           |
| <i>csReturnToInactive</i> | Chip select state                                     |

**Returns**

The current state of the SPI bus [dspiState](#)

Reimplemented in [SPI\\_QSPI](#), and [SPI\\_USART](#).

The documentation for this class was generated from the following files:

- cortex-m7/cpu/SAME70/include/dspi.h
- cortex-m7/cpu/MIMXRT10xx/include/dspi.h

**16.169 SRAM\_Timing\_Spec\_t Struct Reference**

Timing specifications for common SRAM speeds.

```
#include <semc_utils.h>
```

**Public Attributes**

- uint32\_t **address\_access\_time\_ns**  
*tAA - Address to data valid*
- uint32\_t **chip\_enable\_access\_ns**  
*tACE - CE to data valid*
- uint32\_t **output\_enable\_access\_ns**  
*tOE - OE to data valid*
- uint32\_t **write\_cycle\_time\_ns**  
*tWC - Write cycle time*
- uint32\_t **read\_cycle\_time\_ns**  
*tRC - Read cycle time*
- uint32\_t **address\_setup\_time\_ns**  
*tAS - Address setup to WE*
- uint32\_t **address\_hold\_time\_ns**  
*tAH - Address hold from WE*
- uint32\_t **chip\_select\_setup\_ns**  
*tCS - CS setup time*
- uint32\_t **write\_pulse\_width\_ns**  
*tWP - WE pulse width*
- uint32\_t **output\_hold\_time\_ns**  
*tOH - Data hold after OE high*

**16.169.1 Detailed Description**

Timing specifications for common SRAM speeds.

These structures contain typical timing values for different speed grades of asynchronous SRAM devices. Use these as starting points and adjust based on your specific device datasheet.

The documentation for this struct was generated from the following file:

- semc\_utils.h

**16.170 SSC\_cfg\_t Struct Reference**

Configuration structure for the SSC driver. Passed to the initialize function to configure the hardware.

```
#include <ssc_i2s.h>
```

**Public Attributes**

- uint16\_t [clkDiv](#) {150}
- [SSC\\_rxtx\\_cfg\\_t rx](#)
- [SSC\\_rxtx\\_cfg\\_t tx](#)

**16.170.1 Detailed Description**

Configuration structure for the SSC driver. Passed to the initialize function to configure the hardware.

**16.170.2 Member Data Documentation****16.170.2.1 clkDiv**

```
uint16_t SSC_cfg_t::clkDiv {150}
```

The divider value for the peripheral clock used to generate the bit clock when CLK\_SRC\_MCK is selected.

### 16.170.2.2 rx

`SSC_rxtx_cfg_t` `SSC_cfg_t::rx`

The receive configuration.

### 16.170.2.3 tx

`SSC_rxtx_cfg_t` `SSC_cfg_t::tx`

The transmit configuration.

The documentation for this struct was generated from the following file:

- `ssc_i2s.h`

## 16.171 SSC\_rxtx\_cfg\_t Struct Reference

Configuration structure for a given direction (rx or tx) of the SSC module. Passed to the initialize function to configure the hardware.

```
#include <ssc_i2s.h>
```

### Public Attributes

- bool `enable` {false}
- uint8\_t `period` {64}
- uint8\_t `startDly` {1}
- startCond\_t `startCond` {START\_FRAME\_EDGE}
- clkGate\_t `clkGate` {CLK\_GATE\_CONTINUOUS}
- dataValid\_t `dataValid` {DATA\_VALID\_RISING}
- clkOut\_t `clkOut` {CLK\_OUT\_INPUT}
- clkSrc\_t `clkSrc` {CLK\_SRC\_RK}
- uint8\_t `syncLen` {0}
- frameEdge\_t `syncEdge` {FRAME\_SYNC\_FALLING}
- bool `syncDataEnabled` {false}
- frameSyncOut\_t `syncOut` {FRAME\_SYNC\_INPUT}
- uint8\_t `wordsPerFrame` {1}
- bitOrder\_t `bitOrder` {MOST\_SIG\_FIRST}
- bool `lineIdleState` {1}
- uint8\_t `bitsPerWord` {24}
- bufferDepletionBehavior\_t `depletionBehavior` {DEPLETED\_PAUSE}

### 16.171.1 Detailed Description

Configuration structure for a given direction (rx or tx) of the SSC module. Passed to the initialize function to configure the hardware.

### 16.171.2 Member Data Documentation

#### 16.171.2.1 bitOrder

`bitOrder_t` `SSC_rxtx_cfg_t::bitOrder` {MOST\_SIG\_FIRST}

The bit order of transitions.

#### 16.171.2.2 bitsPerWord

`uint8_t` `SSC_rxtx_cfg_t::bitsPerWord` {24}

The bit width of words to be transferred.

### 16.171.2.3 clkGate

```
clkGate_t SSC_rxtx_cfg_t::clkGate {CLK_GATE_CONTINUOUS}
```

The clock gating condition for this channel.

### 16.171.2.4 clkOut

```
clkOut_t SSC_rxtx_cfg_t::clkOut {CLK_OUT_INPUT}
```

The clock out condition for this channel.

### 16.171.2.5 clkSrc

```
clkSrc_t SSC_rxtx_cfg_t::clkSrc {CLK_SRC_RK}
```

The clock source for this channel.

### 16.171.2.6 dataValid

```
dataValid_t SSC_rxtx_cfg_t::dataValid {DATA_VALID_RISING}
```

The data valid condition for this channel.

### 16.171.2.7 depletionBehavior

```
bufferDepletionBehavior_t SSC_rxtx_cfg_t::depletionBehavior {DEPLETED_PAUSE}
```

The depletion behavior that should be used for driver DMA transfers.

### 16.171.2.8 enable

```
bool SSC_rxtx_cfg_t::enable {false}
```

Whether this direction should be enabled.

### 16.171.2.9 lineIdleState

```
bool SSC_rxtx_cfg_t::lineIdleState {1}
```

The state the line should be driven to when not transmitting a word.

### 16.171.2.10 period

```
uint8_t SSC_rxtx_cfg_t::period {64}
```

The period of each frame, in terms of the bit clock.

### 16.171.2.11 startCond

```
startCond_t SSC_rxtx_cfg_t::startCond {START_FRAME_EDGE}
```

The starting condition for this channel.

### 16.171.2.12 startDly

```
uint8_t SSC_rxtx_cfg_t::startDly {1}
```

How many bit periods should data be delayed by at the start of the frame.

### 16.171.2.13 syncDataEnabled

```
bool SSC_rxtx_cfg_t::syncDataEnabled {false}
```

Whether synchronizing data is used.

### 16.171.2.14 syncEdge

```
frameEdge_t SSC_rxtx_cfg_t::syncEdge {FRAME_SYNC_FALLING}
```

The frame sync edge defining frame start.

### 16.171.2.15 syncLen

```
uint8_t SSC_rxtx_cfg_t::syncLen {0}
```

The bit length of the synchronization data (when used).

### 16.171.2.16 syncOut

```
frameSyncOut_t SSC_rxtx_cfg_t::syncOut {FRAME_SYNC_INPUT}
```

The frame sync output configuration.

### 16.171.2.17 wordsPerFrame

```
uint8_t SSC_rxtx_cfg_t::wordsPerFrame {1}
```

Number of words contained in a frame.

The documentation for this struct was generated from the following file:

- `ssc_i2s.h`

## 16.172 SSCctx\_t Class Reference

```
#include <ssc_i2s.h>
```

### Public Member Functions

- `int Init (const SSC\_cfg\_t &cfg)`  
*Initializes the SSC hardware and driver context.*
- `void Shutdown ()`  
*Shuts down the SSC hardware and driver.*
- `int getCurrentConfig (SSC\_cfg\_t &cfg)`  
*Fills in the config object with the current active configuration.*
- `ctxState_t getState ()`  
*Returns the current driver state.*
- `int TransmitBuffer (void *buffer, uint32_t bufferLen, bool waitIfNeeded)`  
*Hands off a buffer to be transmitted by the SSC driver.*
- `int ReadyReceiveBuffer (void *buffer, uint32_t bufferLen, bool waitIfNeeded)`  
*Hands off a buffer to be written to by the SSC driver.*
- `void RegisterTxBufferDoneCB (SSC_BufferDoneFn_t cb)`  
*Registers a callback for when a transmit buffer is finished.*
- `void RegisterRxBufferDoneCB (SSC_BufferDoneFn_t cb)`  
*Registers a callback for when a receive buffer is finished.*

### 16.172.1 Detailed Description

`SSCctx_t` is a driver for the Synchronous Serial Controller. It operates on a buffer level, where buffers are handed to the system and either transmitted or filled with received data as appropriate.

### 16.172.2 Member Function Documentation

#### 16.172.2.1 getCurrentConfig()

```
int SSCctx_t::getCurrentConfig (
 SSC_cfg_t & cfg)
```

Fills in the config object with the current active configuration.

#### Parameters

|     |     |                                       |
|-----|-----|---------------------------------------|
| out | cfg | The configuration object to populate. |
|-----|-----|---------------------------------------|

**Returns**

Negative on failure.

**16.172.2.2 getState()**

```
ctxState_t SSCCtx_t::getState ()
```

Returns the current driver state.

**Returns**

The current driver state.

**16.172.2.3 Init()**

```
int SSCCtx_t::Init (
 const SSC_cfg_t & cfg)
```

Initializes the SSC hardware and driver context.

**Parameters**

|           |            |                           |
|-----------|------------|---------------------------|
| <i>in</i> | <i>cfg</i> | The configuration to use. |
|-----------|------------|---------------------------|

**Returns**

Negative on failure.

**16.172.2.4 ReadyReceiveBuffer()**

```
int SSCCtx_t::ReadyReceiveBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded)
```

Hands off a buffer to be written to by the SSC driver.

**Parameters**

|                     |                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>       | A pointer to the buffer to be written to.                                                                   |
| <i>bufferLen</i>    | The length of the buffer to be written. (Must be multiples of 1, 2, or 4 bytes depending on word bit width) |
| <i>waitIfNeeded</i> | Whether the driver should wait for space to receive or fail immediately upon exhausting the queue depth.    |

**Returns**

Negative on failure.

**16.172.2.5 TransmitBuffer()**

```
int SSCCtx_t::TransmitBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded)
```

Hands off a buffer to be transmitted by the SSC driver.

## Parameters

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>       | A pointer to the buffer to be transmit.                                                                      |
| <i>bufferLen</i>    | The length of the buffer to be transmit. (Must be multiples of 1, 2, or 4 bytes depending on word bit width) |
| <i>waitIfNeeded</i> | Whether the driver should wait for space to transmit or fail immediately upon exhausting the queue depth.    |

## Returns

Negative on failure.

The documentation for this class was generated from the following files:

- ssc\_i2s.h
- ssc\_i2s.cpp

## 16.173 StopWatch Class Reference

High-resolution stopwatch timer for precise event timing and performance measurement.

```
#include <stopwatch.h>
```

## Public Member Functions

- [StopWatch](#) (int timer\_number=FIRST\_UNUSED\_TIMER)  
*Construct a stopwatch object with optional timer selection.*
- void [Start](#) (bool clear\_count=false)  
*Start or resume the stopwatch timer.*

### 16.173.1 Detailed Description

High-resolution stopwatch timer for precise event timing and performance measurement.

The [StopWatch](#) class provides a hardware-based timer interface for measuring time intervals with resolution far exceeding the RTOS tick rate. It is ideal for performance profiling, timeout detection, and precise event timing.

The stopwatch operates in two states:

- **Running:** Timer is actively counting elapsed time
- **Stopped:** Timer preserves elapsed time but does not increment

Time accumulates across multiple Start/Stop cycles unless explicitly cleared, making it useful for measuring cumulative execution time across multiple code sections or function calls.

#### 16.173.1.1 Thread Safety

[StopWatch](#) objects are not inherently thread-safe. If multiple tasks need to access the same [StopWatch](#), appropriate synchronization (mutexes, semaphores) must be used to prevent race conditions.

### 16.173.1.2 Timer Allocation

On most platforms, hardware timers are automatically allocated. Some older platforms may require explicit timer number specification via the constructor.

#### Note

The internal time representation uses unsigned long long to prevent overflow for extended timing periods, supporting timing intervals of years without rollover on typical hardware.

## 16.173.2 Constructor & Destructor Documentation

### 16.173.2.1 Stopwatch()

```
StopWatch::StopWatch (
 int timer_number = FIRST_UNUSED_TIMER)
```

Construct a stopwatch object with optional timer selection.

Creates a new [StopWatch](#) instance and allocates a hardware timer for timing operations. On modern platforms with dedicated RTOS timers, the timer\_number parameter can be omitted and the system will automatically select an available timer resource.

The stopwatch is created in a stopped state with zero elapsed time. Call [Start\(\)](#) to begin timing.

#### Parameters

|                     |                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>timer_number</i> | Optional timer resource identifier. Use FIRST_UNUSED_TIMER (default) for automatic allocation, or specify a specific timer number if your platform requires explicit timer selection. Valid timer numbers are platform-dependent. |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Note

After construction, the stopwatch is in a stopped state with [GetTime\(\)](#) returning 0 until [Start\(\)](#) is called.

#### Warning

On platforms with limited timer resources, ensure you don't create more [StopWatch](#) instances than available hardware timers. Check your platform documentation for timer availability.

#### Example:

```
StopWatch timer1; // Automatic timer allocation
StopWatch timer2(FIRST_UNUSED_TIMER); // Explicit automatic allocation
StopWatch timer3(2); // Use specific timer #2 (platform-dependent)
```

## 16.173.3 Member Function Documentation

### 16.173.3.1 Clear()

```
void StopWatch::Clear ()
```

Clear the accumulated elapsed time.

Resets the stopwatch's elapsed time counter to zero. If the stopwatch is currently running, it continues running but from a zero starting point. If stopped, the elapsed time is simply cleared.

This is equivalent to calling [Start\(true\)](#) but works whether the stopwatch is running or stopped.

#### Note

After calling [Clear\(\)](#), [GetTime\(\)](#) will return 0 until time accumulates.

This function does not change the running/stopped state of the stopwatch.

#### Example:

```
StopWatch timer;

timer.Start();
DoWork();
```

```

timer.Stop();

printf("First measurement: %llu\n", timer.GetTime());

timer.Clear(); // Reset to zero

timer.Start();
DoMoreWork();
timer.Stop();

printf("Second measurement: %llu\n", timer.GetTime());

```

**See also**[Start\(\)](#)[Stop\(\)](#)**16.173.3.2 Convert()**

```

double Stopwatch::Convert (
 unsigned long long ticks)

```

Convert timer ticks to seconds.

Converts a time interval or elapsed time value from hardware timer ticks (as returned by [Stop\(\)](#) or [GetTime\(\)](#)) to seconds as a double precision floating point number. This provides a human-readable representation of the measured time.

The conversion accounts for the platform's timer frequency and provides accurate time representation suitable for display, logging, or mathematical operations requiring time in standard units.

**Parameters**

|              |                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ticks</i> | The time value in hardware timer ticks to convert. This is typically obtained from <a href="#">Stop()</a> or <a href="#">GetTime()</a> . |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

The equivalent time in seconds as a double precision floating point number. The precision depends on the timer resolution (see [CountResolution\(\)](#)).

**Note**

The input value should be a tick count from this [StopWatch](#) instance. Tick values from other timers or sources may have different meanings.

The conversion is: seconds = ticks x [CountResolution\(\)](#)

For very long timing intervals (hours/days), be aware of floating point precision limitations in the double type, though this is rarely an issue in practice for timing applications.

**Example - Basic conversion:**

```

StopWatch timer;

timer.Start();
PerformOperation();
unsigned long long ticks = timer.Stop();

double seconds = timer.Convert(ticks);
printf("Operation took %f seconds\n", seconds);

```

**Example - Display in multiple units:**

```

StopWatch timer;

timer.Start();
DoWork();
unsigned long long ticks = timer.Stop();

double seconds = timer.Convert(ticks);
double milliseconds = seconds * 1000.0;
double microseconds = seconds * 1000000.0;

printf("Elapsed time:\n");
printf(" %f seconds\n", seconds);
printf(" %f milliseconds\n", milliseconds);
printf(" %f microseconds\n", microseconds);

```

```
printf(" %llu ticks\n", ticks);
```

**Example - Performance comparison:**

```
StopWatch timer;

timer.Start();
Method1();
unsigned long long time1 = timer.Stop();

timer.Start(true); // Clear and restart
Method2();
unsigned long long time2 = timer.Stop();

double seconds1 = timer.Convert(time1);
double seconds2 = timer.Convert(time2);

printf("Method1: %f seconds\n", seconds1);
printf("Method2: %f seconds\n", seconds2);

if (seconds1 < seconds2)
 printf("Method1 is %.2fx faster\n", seconds2 / seconds1);
else
 printf("Method2 is %.2fx faster\n", seconds1 / seconds2);
```

**Example - Throughput calculation:**

```
StopWatch timer;
int itemsProcessed = 1000000;

timer.Start();
for (int i = 0; i < itemsProcessed; i++)
 ProcessItem(i);
unsigned long long ticks = timer.Stop();

double seconds = timer.Convert(ticks);
double itemsPerSecond = itemsProcessed / seconds;
double secondsPerItem = seconds / itemsProcessed;

printf("Processed %d items in %f seconds\n", itemsProcessed, seconds);
printf("Throughput: %.2f items/second\n", itemsPerSecond);
printf("Average: %e seconds/item\n", secondsPerItem);
```

**See also**

[Stop\(\)](#)  
[GetTime\(\)](#)  
[CountResolution\(\)](#)

### 16.173.3.3 CountResolution()

```
double Stopwatch::CountResolution ()
```

Get the resolution of a single timer tick in seconds.

Returns the time value of one hardware timer tick, expressed as a double precision floating point number in seconds.

This represents the finest granularity at which the stopwatch can measure time.

The resolution depends on the hardware timer frequency and typically ranges from nanoseconds to microseconds on NetBurner platforms. Higher resolution (smaller tick duration) provides more precise timing measurements.

**Returns**

The duration of one timer tick in seconds as a double. For example, a return value of 0.000001 indicates 1 microsecond resolution, while 0.000000001 indicates 1 nanosecond resolution.

**Note**

This value is constant for a given platform and timer configuration.

The resolution represents the theoretical precision; actual measurement accuracy may be affected by interrupt latency and system load.

**Example - Display timer characteristics:**

```
StopWatch timer;
double resolution = timer.CountResolution();

printf("Stopwatch timer resolution:\n");
printf(" Per tick: %e seconds\n", resolution);
printf(" Per tick: %f microseconds\n", resolution * 1e6);
printf(" Per tick: %f nanoseconds\n", resolution * 1e9);
```

Example - Calculate measurement precision:

```
StopWatch timer;
double resolution = timer.CountResolution();

timer.Start();
QuickOperation();
unsigned long long ticks = timer.Stop();

double time = timer.Convert(ticks);
double precision = resolution;

printf("Measured time: %f +/- %f seconds\n", time, precision);
```

Example - Validate timing requirements:

```
StopWatch timer;
double resolution = timer.CountResolution();
double required_precision = 0.000001; // 1 microsecond

if (resolution > required_precision)
{
 printf("Warning: Timer resolution (%e s) is insufficient\n", resolution);
 printf("Required: %e s\n", required_precision);
}
else
{
 printf("Timer resolution (%e s) is adequate\n", resolution);
}
```

[Convert\(\)](#)

[GetTime\(\)](#)

#### 16.173.3.4 GetTime()

```
unsigned long long Stopwatch::GetTime ()
```

Get the current elapsed time without stopping the timer.

Returns the current accumulated elapsed time in hardware timer ticks. Unlike [Stop\(\)](#), this function does not change the state of the stopwatch - if the timer is running, it continues running; if stopped, it remains stopped.

This is particularly useful for checking progress during long operations, implementing timeouts, or monitoring timing without interrupting the measurement.

##### Returns

The current accumulated elapsed time in hardware timer ticks. If the stopwatch is running, this includes time up to the moment of the call. If stopped, this returns the time at which [Stop\(\)](#) was called. Use [Convert\(\)](#) to convert this value to seconds.

##### Note

This function can be called while the timer is running or stopped.

The returned value is in hardware timer ticks. Use [Convert\(\)](#) to convert to seconds or other time units.

On running timers, consecutive calls to [GetTime\(\)](#) will return increasing values. On stopped timers, consecutive calls return the same value.

Example - Check progress without stopping:

```
StopWatch timer;
timer.Start();

while (ProcessingData())
{
 // Check time periodically without stopping
 double elapsed = timer.Convert(timer.GetTime());
 if (elapsed > MAX_ALLOWED_SECONDS)
 {
 printf("Warning: Operation exceeding time limit!\n");
 break;
 }
}

timer.Stop();
```

Example - Timeout implementation:

```
StopWatch timer;
```

```

timer.Start();

while (!OperationComplete())
{
 DoWork();

 if (timer.Convert(timer.GetTime()) > TIMEOUT_SECONDS)
 {
 printf("Operation timed out!\n");
 return ERROR_TIMEOUT;
 }
}

timer.Stop();
return SUCCESS;

```

**Example - Progress reporting:**

```

StopWatch timer;
timer.Start();

for (int i = 0; i < totalItems; i++)
{
 ProcessItem(i);

 if (i % 100 == 0)
 {
 double elapsed = timer.Convert(timer.GetTime());
 printf("Processed %d items in %.2f seconds\n", i, elapsed);
 }
}

timer.Stop();

```

**See also**

[Stop\(\)](#)  
[Start\(\)](#)  
[Convert\(\)](#)

**16.173.3.5 Start()**

```

void Stopwatch::Start (
 bool clear_count = false)

```

Start or resume the stopwatch timer.

Begins timing from the current moment. If the stopwatch was previously stopped, it will continue accumulating time from the last elapsed value unless `clear_count` is true. This allows for cumulative timing across multiple Start/Stop cycles.

If called when the stopwatch is already running, this function has no effect unless `clear_count` is true, in which case it restarts timing from zero.

**Parameters**

|                    |                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clear_count</i> | If true, resets the elapsed time to zero before starting. If false (default), continues accumulating time from the previous elapsed value, enabling cumulative timing. |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note**

Calling [Start\(\)](#) multiple times without stopping has no effect unless `clear_count` is true.

This function uses hardware timer reads and is very fast (typically < 1 microsecond overhead).

**Example - Basic timing:**

```

StopWatch timer;
timer.Start();
PerformOperation();
timer.Stop();

```

**Example - Cumulative timing:**

```

StopWatch timer;

timer.Start();
Operation1();
timer.Stop();

// Continue timing - adds to previous elapsed time

```

```
timer.Start();
Operation2();
timer.Stop();

// Total time for both operations
double total = timer.Convert(timer.GetTime());
```

**Example - Restart from zero:**

```
StopWatch timer;

timer.Start();
FirstMeasurement();
timer.Stop();

// Start fresh measurement
timer.Start(true); // Clear previous time
SecondMeasurement();
timer.Stop();
```

**See also**

[Stop\(\)](#)  
[Clear\(\)](#)  
[GetTime\(\)](#)

### 16.173.3.6 Stop()

```
unsigned long long Stopwatch::Stop ()
```

Stop the stopwatch and return elapsed time.

Stops the stopwatch timer and returns the total accumulated elapsed time in hardware timer ticks. The elapsed time is preserved and will continue to accumulate if [Start\(\)](#) is called again without clearing.

If the stopwatch is already stopped, this function simply returns the current elapsed time without modifying the stopwatch state.

**Returns**

The total accumulated elapsed time in hardware timer ticks since the stopwatch was started (or last cleared). Use [Convert\(\)](#) to convert this value to seconds.

**Note**

The returned value is in hardware timer ticks, not seconds. Use [Convert\(\)](#) to convert to human-readable time units.

Calling [Stop\(\)](#) multiple times returns the same value until [Start\(\)](#) is called again.

**Example - Basic stop and convert:**

```
StopWatch timer;
timer.Start();
PerformOperation();
unsigned long long ticks = timer.Stop();
double seconds = timer.Convert(ticks);
printf("Operation took %f seconds (%llu ticks)\n", seconds, ticks);
```

**Example - Multiple stop calls:**

```
StopWatch timer;
timer.Start();
DoWork();

unsigned long long time1 = timer.Stop(); // Stops and gets time
unsigned long long time2 = timer.Stop(); // Same value as time1
// time1 == time2
```

## 16.175.1 Detailed Description

Easy class for registering a callback function that receives messages on an [MQTT](#) topic and handles them appropriately. Behaves similarly to [HttpResponseHandler](#).

## 16.175.2 Constructor & Destructor Documentation

### 16.175.2.1 SubHandler()

```
MQTT::SubHandler::SubHandler (
 SubHandlerCb handler,
 const char * topicFilter,
 Client * mClient = NULL,
 uint16_t flags = 0)
```

[SubHandler](#) Constructor for a standalone [SubHandler](#) object.

#### Parameters

|                     |                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>handler</i>      | Function that should be called when a message is received                                                                          |
| <i>*topicFilter</i> | Mqtt Topic Filter to Subscribe to                                                                                                  |
| <i>*mClient</i>     | Pointer to <a href="#">Client</a> to register with. If NULL, it will be registered with the first created <a href="#">Client</a> . |
| <i>flags</i>        | Behavioral flags to set on the created object                                                                                      |

## 16.175.3 Member Function Documentation

### 16.175.3.1 ParseFd()

```
virtual int MQTT::SubHandler::ParseFd (
 int mqttFd) [override], [protected], [virtual]
```

[SubHandler::ParseFd](#) Parse the data from a file descriptor according to this object's current default serialization method and assign the value.

#### Parameters

|               |                               |
|---------------|-------------------------------|
| <i>mqttFd</i> | File descriptor to read from. |
|---------------|-------------------------------|

#### Returns

eResult\_t return code

Implements [MQTT::mqtt\\_leaf](#).

### 16.175.3.2 RenderToBuffer()

```
virtual int MQTT::SubHandler::RenderToBuffer (
 eObj_Serialize_t form,
 uint8_t * buf,
 int buflen) [override], [protected], [virtual]
```

[SubHandler::RenderToBuffer](#) Render this object to an output buffer.

#### Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>form</i>   | Serialization format to render as |
| <i>*buf</i>   | Pointer to output buffer          |
| <i>buflen</i> | Size of the output buffer         |

#### Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

### 16.175.3.3 RenderToFd()

```
virtual int MQTT::SubHandler::RenderToFd (
 eObj_Serialize_t form,
 int fd) [override], [protected], [virtual]
```

[SubHandler::RenderToFd](#) Render this object to an output socket.

#### Parameters

|             |                                   |
|-------------|-----------------------------------|
| <i>form</i> | Serialization format to render as |
| <i>fd</i>   | File descriptor to render to      |

#### Returns

Length of the rendered data

Implements [MQTT::mqtt\\_leaf](#).

#### 16.175.3.4 SubscribeEvent()

```
virtual int MQTT::SubHandler::SubscribeEvent (
 int mqttFd,
 PacketInfo::Msg * msg) [override], [virtual]
```

[SubHandler::SubscribeEvent](#) Handle a message sent by the Broker triggered by this object's Subscription.

## Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>mqttFd</i> | File Descriptor to read any additional message data from |
| <i>*msg</i>   | Pointer to message received from the Broker              |

## Returns

eResult\_t return code

Reimplemented from [MQTT::mqtt\\_leaf](#).

**16.175.3.5 TestOrSetValue()**

```
virtual ValueTestResult MQTT::SubHandler::TestOrSetValue (
 ParsedJsonDataSet & pjs,
 bool setVal) [override], [virtual]
```

[SubHandler::TestOrSetValue](#) Test whether the current index of a JSON dataset is valid for this object, or assign the value at the current index of the dataset to this object.

## Parameters

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| <i>&amp;pjs</i> | The JSON dataset to use                                                                                 |
| <i>setVal</i>   | true: Assign from the value at the current index, false: test if current index is valid for this object |

## Returns

ValueTestResult indicating the validity of the current index

Implements [MQTT::mqtt\\_leaf](#).

**16.176 MQTT::SubscribeFilter Struct Reference**

Structure used to specify a topic filter for subscriptions.

```
#include <mqtt_msg_reqs.h>
```

**16.176.1 Detailed Description**

Structure used to specify a topic filter for subscriptions.

The documentation for this struct was generated from the following file:

- mqtt\_msg\_reqs.h

**16.177 MQTT::SubscribeFilter\_NbStr Struct Reference**

Structure used to specify a topic filter for subscriptions.

```
#include <mqtt_msg_reqs.h>
```

**16.177.1 Detailed Description**

Structure used to specify a topic filter for subscriptions.

The documentation for this struct was generated from the following file:

- mqtt\_msg\_reqs.h

## 16.178 MQTT::SubscribeRequest Struct Reference

Structure used to specify details for a Subscribe call.

```
#include <mqtt_msg_reqs.h>
```

### 16.178.1 Detailed Description

Structure used to specify details for a Subscribe call.

The documentation for this struct was generated from the following file:

- mqtt\_msg\_reqs.h

## 16.179 TFTP\_Server Class Reference

TFTP Server Class.

```
#include <tftp_server.h>
```

Inherits servlet, and TimeOutElement.

### Public Member Functions

- [TFTP\\_Server](#) (uint16\_t port=69)  
*TFTP server constructor.*
- void [Add](#) ([TFTP\\_Server\\_source\\_File](#) &sf)  
*Specify TFTP Server listen port number, default is 69.*

### 16.179.1 Detailed Description

TFTP Server Class.

Creates a TFTP Server Servlet

### 16.179.2 Constructor & Destructor Documentation

#### 16.179.2.1 TFTP\_Server()

```
TFTP_Server::TFTP_Server (
 uint16_t port = 69)
```

TFTP server constructor.

#### Parameters

|             |                                             |
|-------------|---------------------------------------------|
| <i>port</i> | Optional listen port number. Default is 69. |
|-------------|---------------------------------------------|

### 16.179.3 Member Function Documentation

#### 16.179.3.1 Add()

```
void TFTP_Server::Add (
 TFTP_Server_source_File & sf)
```

Specify TFTP Server listen port number, default is 69.

#### Parameters

|           |                             |
|-----------|-----------------------------|
| <i>sf</i> | Reference to file to share. |
|-----------|-----------------------------|

The documentation for this class was generated from the following file:

- tftp\_server.h

## 16.180 TFTP\_Server\_source\_File Class Reference

TFTP Server Source File.

```
#include <tftp_server.h>
```

### Friends

- class **TFTP\_Server**

### 16.180.1 Detailed Description

TFTP Server Source File.

Specify a source file to serve

The documentation for this class was generated from the following file:

- tftp\_server.h

## 16.181 TimeZoneRecord Struct Reference

Time zone record structure containing complete time zone information.

```
#include <timezones.h>
```

### Public Attributes

- const char \* [Posix](#)  
*POSIX-compliant time zone string.*
- const char \* [Description](#)  
*Human-readable time zone description.*
- const char \* [Name](#)  
*Formal time zone name.*
- const char \* [Short\\_name](#)  
*Abbreviated time zone name.*
- int [bUsCanada](#)  
*US/Canada time zone flag.*

### 16.181.1 Detailed Description

Time zone record structure containing complete time zone information.

This structure defines a time zone with all necessary information for proper time conversion and display. The NetBurner system provides an array of over 75 pre-configured time zones covering all major regions worldwide.

The POSIX timezone string format is:

```
std offset[dst[offset][,start[/time],end[/time]]]
```

Where:

- `std` = Standard time zone abbreviation (e.g., "PST", "CET")
- `offset` = Hours offset from UTC (e.g., "8" for PST = UTC-8)
- `dst` = Daylight saving time abbreviation (e.g., "PDT", "CEST")
- `start` = DST start rule (e.g., "M3.2.0" = 2nd Sunday in March)
- `end` = DST end rule (e.g., "M11.1.0" = 1st Sunday in November)

### Note

All time zone records are defined as const data in timezones.cpp

**Example Time Zone Records:**

```
// Pacific Time (US West Coast)
{"PST8PDT,M3.2.0,M11.1.0",
 "(GMT-08:00) Pacific Time (US and Canada); Tijuana",
 "Pacific Standard Time",
 "PST ",
 1}

// Central European Time
{"CET-1CEST,M3.5.0,M10.5.0/3",
 "(GMT+01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna",
 "W. Europe Standard Time",
 "CET ",
 0}

// Japan (no DST)
{"JST-9",
 "(GMT+09:00) Osaka, Sapporo, Tokyo",
 "Tokyo Standard Time",
 "JST ",
 0}
```

**Usage Example:**

```
#include <timezones.h>
#include <ntp.h>

void SetupTimeZone() {
 // Search for Pacific Time zone
 const TimeZoneRecord *tz = TZRecords;
 while (tz->Posix != NULL) {
 if (strstr(tz->Description, "Pacific Time") != NULL) {
 // Set the system time zone
 tzset(tz->Posix);
 iprintf("Set timezone to: %s\r\n", tz->Description);
 break;
 }
 tz++;
 }
}
```

**16.181.2 Member Data Documentation****16.181.2.1 bUsCanada**

```
int TimeZoneRecord::bUsCanada
```

US/Canada time zone flag.

Indicates whether this time zone is used in the United States and/or Canada. This flag can be used to filter time zones by region or to apply region-specific time zone selection logic.

**Returns**

- 1: Time zone is used in US and/or Canada
- 0: Time zone is used elsewhere (Europe, Asia, etc.)

**Note**

Some time zones span multiple regions. This flag indicates primary usage region.

**16.181.2.2 Description**

```
const char* TimeZoneRecord::Description
```

Human-readable time zone description.

A descriptive string that includes the GMT offset and major cities or regions in the time zone. This is useful for displaying time zone selections to users.

Format: "(GMT +/- HH:MM) City/Region descriptions"

Examples:

- "(GMT-08:00) Pacific Time (US and Canada); Tijuana"
- "(GMT+01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna"
- "(GMT+09:00) Osaka, Sapporo, Tokyo"

### 16.181.2.3 Name

```
const char* TimeZoneRecord::Name
```

Formal time zone name.

The official or formal name of the time zone, often matching Windows time zone names for compatibility. Used for documentation and display.

Examples:

- "Pacific Standard Time"
- "W. Europe Standard Time"
- "Tokyo Standard Time"

### 16.181.2.4 Posix

```
const char* TimeZoneRecord::Posix
```

POSIX-compliant time zone string.

The POSIX timezone string defines the time zone offset from UTC and optional daylight saving time rules. This string is used with the standard `tzset()` function to configure the system's time zone.

Format examples:

- "PST8PDT,M3.2.0,M11.1.0" - Pacific Time with DST
- "CET-1CEST,M3.5.0,M10.5.0/3" - Central European Time with DST
- "JST-9" - Japan Standard Time (no DST)
- "UTC0" - Coordinated Universal Time

#### Note

Negative offsets indicate zones west of UTC, positive east of UTC

### 16.181.2.5 Short\_name

```
const char* TimeZoneRecord::Short_name
```

Abbreviated time zone name.

A short 3-6 character abbreviation for the standard time zone name. This is typically the standard time abbreviation (not DST). Padded with spaces to 6 characters for alignment.

Examples:

- "PST " (Pacific Standard Time)
- "CET " (Central European Time)
- "JST " (Japan Standard Time)
- "UTC " (Coordinated Universal Time)

The documentation for this struct was generated from the following file:

- `timezones.h`

## 16.182 MQTT::TopicHandler Struct Reference

[TopicHandler](#) context definition.

```
#include <mqtt.h>
```

**Public Attributes**

- **NBString** **topicFilter**  
*Filter used to describe which topics this handler covers.*
- **MsgCallback\_t** **handleMsg**  
*Handler method to call.*
- void \* **ctx**  
*User provided extra data passed to the handler method.*

**16.182.1 Detailed Description**

**TopicHandler** context definition.

This struture holds the context information that a **Client** uses to dispatch recieved messages to the appropriate callback function to handle that message.

The documentation for this struct was generated from the following file:

- mqtt.h

**16.183 TwoWire Class Reference**

Wire interface class.

```
#include <Wire.h>
```

**Public Member Functions**

- **TwoWire** (void)  
*Wire Constructor with platform default I2C module.*
- **TwoWire** (int mod)  
*Wire Constructor with specified module.*
- **TwoWire** (PinIO scl, PinIO sda)  
*Constructor.*
- void **setClock** (uint32\_t clockbaud)  
*Set baud rate.*
- void **begin** (uint8\_t slave\_addr=0)  
*Inititalize the system.*
- void **end** ()  
*Turn system off.*
- void **beginTransaction** (uint8\_t address)  
*Set up a start for writing.*
- int **endTransmission** (bool bStop=true)  
*Do a stop with restart.*
- size\_t **write** (const uint8\_t \*pdata, int len)  
*Send data to the target device.*
- size\_t **write** (char v)  
*Send a char to the target device.*
- size\_t **write** (uint8\_t v)  
*Send an int to the target device.*
- size\_t **write** (const char \*pStr, int len=-1)  
*Send a string to the target device.*
- int **requestFrom** (uint8\_t address, size\_t quantity, bool stop=true)  
*Request bytes from the target device.*
- size\_t **available** ()  
*Check if any bytes are available to read.*

- `size_t read (uint8_t *pbuf, size_t maxlen)`  
*Read available data up to maxlen bytes (Not a standard Wire function)*
- `uint8_t read ()`  
*Read the next byte from the buffer.*

#### Target functions

- void `onReceive (slave_rx_handler *handler)`  
*Register a Receive callback (Does not work on the [BBI2C](#) software interface)*
- void `onRequest (slave_rq_handler *handler)`  
*Register a Request callback (Does not work on the [BBI2C](#) software interface)*
- void `setWireTimeout (int timeout_usec=0, bool reset_on_timeout=false)`  
*Set the completion timeout.*
- void `clearTimeout ()`  
*Clear the completion timeout.*
- bool `getWireTimeoutFlag ()`  
*Get whether there is a completion timeout set.*

#### Non-standard extensions

- void `reset ()`  
*Reset the [I2C](#) system and unhang the bus.*
- bool `ping (uint8_t addr)`  
*Check to see if addr exists on this bus.*
- int `writeRegN (uint8_t dAddr, uint32_t reg, const uint8_t *buf, uint32_t blen)`  
*Write a number of 8-bit values to an [I2C](#) slave to the specified register address.*
- int `readRegN (uint8_t dAddr, uint32_t reg, uint8_t *buf, uint32_t blen)`  
*Read a number of 8-bit values from an [I2C](#) slave at the specified register address.*
- int `writeReg8 (uint8_t dAddr, uint32_t reg, uint8_t data)`  
*Write an 8-bit value to a [I2C](#) target device register.*
- int `readReg8 (uint8_t dAddr, uint32_t reg, uint8_t &data)`  
*Read an 8-bit value from an [I2C](#) target device register.*

### 16.183.1 Detailed Description

Wire interface class.

### 16.183.2 Constructor & Destructor Documentation

#### 16.183.2.1 TwoWire() [1/2]

```
TwoWire::TwoWire (
 int mod)
```

Wire Constructor with specified module.

##### Parameters

|            |                                   |
|------------|-----------------------------------|
| <i>mod</i> | <a href="#">I2C</a> module number |
|------------|-----------------------------------|

#### 16.183.2.2 TwoWire() [2/2]

```
TwoWire::TwoWire (
 PinIO scl,
 PinIO sda)
```

Constructor.

## Parameters

|            |         |
|------------|---------|
| <i>scl</i> | SCL pin |
| <i>sda</i> | SDA pin |

If [BBI2C](#) is defined, this will automatically use software [I2C](#) if the specified pins don't map to a hardware [I2C](#) device

### 16.183.3 Member Function Documentation

#### 16.183.3.1 available()

```
size_t TwoWire::available ()
```

Check if any bytes are available to read.

## Return values

|               |                                  |
|---------------|----------------------------------|
| <i>Number</i> | of bytes available in the buffer |
|---------------|----------------------------------|

#### 16.183.3.2 begin()

```
void TwoWire::begin (
 uint8_t slave_addr = 0)
```

Initialize the system.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <i>slave_addr</i> | Address of the target device |
|-------------------|------------------------------|

#### 16.183.3.3 beginTransmission()

```
void TwoWire::beginTransmission (
 uint8_t address)
```

Set up a start for writing.

## Parameters

|                |                              |
|----------------|------------------------------|
| <i>address</i> | Address of the target device |
|----------------|------------------------------|

#### 16.183.3.4 endTransmission()

```
int TwoWire::endTransmission (
 bool bStop = true)
```

Do a stop with restart.

## Parameters

|              |                                                    |
|--------------|----------------------------------------------------|
| <i>bStop</i> | If true, sends a stop message and releases the bus |
|--------------|----------------------------------------------------|

## Return values

|   |                 |
|---|-----------------|
| 0 | Success         |
| 1 | Data too big    |
| 2 | NACK on address |

|   |              |
|---|--------------|
| 3 | NACK on data |
| 4 | Other error  |
| 5 | Timeout      |

#### 16.183.3.5 onReceive()

```
void TwoWire::onReceive (
 slave_rx_handler * handler)
```

Register a Receive callback (Does not work on the [BBI2C](#) software interface)

##### Parameters

|                |                                                         |
|----------------|---------------------------------------------------------|
| <i>handler</i> | Pointer to the function to call when bytes are received |
|----------------|---------------------------------------------------------|

#### 16.183.3.6 onRequest()

```
void TwoWire::onRequest (
 slave_rq_handler * handler)
```

Register a Request callback (Does not work on the [BBI2C](#) software interface)

##### Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>handler</i> | Pointer to the function to call when bytes are requested |
|----------------|----------------------------------------------------------|

#### 16.183.3.7 ping()

```
bool TwoWire::ping (
 uint8_t addr)
```

Check to see if addr exists on this bus.

##### Return values

|             |                       |
|-------------|-----------------------|
| <i>true</i> | if the address exists |
|-------------|-----------------------|

#### 16.183.3.8 read() [1/2]

```
uint8_t TwoWire::read () [inline]
```

Read the next byte from the buffer.

##### Return values

|            |                              |
|------------|------------------------------|
| <i>One</i> | byte of data from the buffer |
|------------|------------------------------|

#### 16.183.3.9 read() [2/2]

```
size_t TwoWire::read (
 uint8_t * pbuf,
 size_t maxlen)
```

Read available data up to maxlen bytes (Not a standard Wire function)

## Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>pbuf</i>   | Pointer to a buffer to read bytes into |
| <i>maxlen</i> | Maximum number of bytes to read        |

## Return values

|   |                              |
|---|------------------------------|
| 0 | if no read data is available |
|---|------------------------------|

**16.183.3.10 readReg8()**

```
int TwoWire::readReg8 (
 uint8_t dAddr,
 uint32_t reg,
 uint8_t & data) [inline]
```

Read an 8-bit value from an [I2C](#) target device register.

## Parameters

|              |                                                           |
|--------------|-----------------------------------------------------------|
| <i>dAddr</i> | Address of <a href="#">I2C</a> device                     |
| <i>reg</i>   | Register address to read                                  |
| <i>data</i>  | Reference to variable in which to store the register data |

## Returns

result code.

**16.183.3.11 readRegN()**

```
int TwoWire::readRegN (
 uint8_t dAddr,
 uint32_t reg,
 uint8_t * buf,
 uint32_t blen)
```

Read a number of 8-bit values from an [I2C](#) slave at the specified register address.

## Parameters

|              |                                          |
|--------------|------------------------------------------|
| <i>dAddr</i> | Address of <a href="#">I2C</a> device    |
| <i>reg</i>   | Register address to read                 |
| <i>*buf</i>  | Pointer to buffer to store received data |
| <i>blen</i>  | Number of bytes to read                  |

## Returns

result code.

**16.183.3.12 requestFrom()**

```
int TwoWire::requestFrom (
 uint8_t address,
 size_t quantity,
 bool stop = true)
```

Request bytes from the target device.

## Parameters

|                 |                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------|
| <i>address</i>  | Address of the target device                                                              |
| <i>quantity</i> | How many bytes to request                                                                 |
| <i>stop</i>     | Set true to send a stop message and releases the bus when done, otherwise sends a restart |

## Return values

|               |               |
|---------------|---------------|
| <i>number</i> | of bytes read |
|---------------|---------------|

**16.183.3.13 setClock()**

```
void TwoWire::setClock (
 uint32_t clockbaud) [inline]
```

Set baud rate.

## Parameters

|                  |                            |
|------------------|----------------------------|
| <i>clockbaud</i> | Baud rate (default 200Khz) |
|------------------|----------------------------|

**16.183.3.14 setWireTimeout()**

```
void TwoWire::setWireTimeout (
 int timeout_usec = 0,
 bool reset_on_timeout = false)
```

Set the completion timeout.

## Parameters

|                         |                                                                                  |
|-------------------------|----------------------------------------------------------------------------------|
| <i>timeout_usec</i>     | Timeout in microseconds                                                          |
| <i>reset_on_timeout</i> | Set true to reset the <a href="#">I2C</a> system and unhang the bus upon timeout |

**16.183.3.15 write() [1/4]**

```
size_t TwoWire::write (
 char v) [inline]
```

Send a char to the target device.

## Parameters

|          |                    |
|----------|--------------------|
| <i>v</i> | Character to write |
|----------|--------------------|

## Return values

|               |                  |
|---------------|------------------|
| <i>number</i> | of bytes written |
|---------------|------------------|

**16.183.3.16 write() [2/4]**

```
size_t TwoWire::write (
 const char * pStr,
 int len = -1) [inline]
```

Send a string to the target device.

## Parameters

|             |                        |
|-------------|------------------------|
| <i>pStr</i> | C-style string to send |
| <i>len</i>  | Length of data         |

## Return values

|               |                  |
|---------------|------------------|
| <i>number</i> | of bytes written |
|---------------|------------------|

**16.183.3.17 write() [3/4]**

```
size_t TwoWire::write (
 const uint8_t * pdata,
 int len)
```

Send data to the target device.

## Parameters

|              |                         |
|--------------|-------------------------|
| <i>pdata</i> | Pointer to data to send |
| <i>len</i>   | Length of data          |

## Return values

|               |                  |
|---------------|------------------|
| <i>number</i> | of bytes written |
|---------------|------------------|

**16.183.3.18 write() [4/4]**

```
size_t TwoWire::write (
 uint8_t v) [inline]
```

Send an int to the target device.

## Parameters

|          |                       |
|----------|-----------------------|
| <i>v</i> | Integer data to write |
|----------|-----------------------|

## Return values

|               |                  |
|---------------|------------------|
| <i>number</i> | of bytes written |
|---------------|------------------|

**16.183.3.19 writeReg8()**

```
int TwoWire::writeReg8 (
 uint8_t dAddr,
 uint32_t reg,
 uint8_t data) [inline]
```

Write an 8-bit value to a [I2C](#) target device register.

## Parameters

|              |                                       |
|--------------|---------------------------------------|
| <i>dAddr</i> | Address of <a href="#">I2C</a> device |
| <i>reg</i>   | Register address to write             |
| <i>data</i>  | Data to write to register             |

**Returns**

result code

**16.183.3.20 writeRegN()**

```
int TwoWire::writeRegN (
 uint8_t dAddr,
 uint32_t reg,
 const uint8_t * buf,
 uint32_t blen)
```

Write a number of 8-bit values to an [I2C](#) slave to the specified register address.

Executing this function will send the following: a start bit, the target device address and read/write bit, the 8-bit data bytes, and finally a stop bit. Note that the address is not incremented with each 8-bit data value.

**Parameters**

|              |                                            |
|--------------|--------------------------------------------|
| <i>dAddr</i> | Address of <a href="#">I2C</a> device      |
| <i>reg</i>   | Register address to write                  |
| <i>*buf</i>  | Pointer to buffer containing data to write |
| <i>blen</i>  | Number of bytes to write                   |

**Returns**

result code.

The documentation for this class was generated from the following file:

## 16.184.1 Detailed Description

UDP Packet Class - Complete UDP packet management.

Provides comprehensive UDP packet handling with automatic memory management, flexible data insertion methods, and advanced sending options.

### 16.184.1.1 Transmission Patterns

#### Method 1: `sprintf` with `GetDataBuffer()` - Best for formatted text

```
UDPPacket pkt;
pkt.SetSourcePort(123);
pkt.SetDestinationPort(456);
uint16_t len = sprintf(pkt.GetDataBuffer(), "Temp: %d", temp);
pkt.SetDataSize(len); // IMPORTANT: Must set size!
pkt.Send(destIP);
```

#### Method 2: `AddData()` - Best for binary/incremental data

```
UDPPacket pkt;
pkt.SetSourcePort(123);
pkt.SetDestinationPort(456);
pkt.AddData(header, sizeof(header));
pkt.AddDataWord(sensor);
pkt.Send(destIP);
```

### 16.184.1.2 Reception Pattern

```
OS_FIFO udpFifo;
OSFifoInit(&udpFifo);
RegisterUDPFifo(PORT, &udpFifo);

while (1) {
 UDPPacket pkt(&udpFifo, TICKS_PER_SECOND * 5);
 if (pkt.Validate()) {
 // Process pkt.GetDataBuffer() and pkt.GetDataSize()
 }
}
```

## 16.184.2 Constructor & Destructor Documentation

### 16.184.2.1 UDPPacket() [1/5]

```
UDPPacket::UDPPacket (
 OS_FIFO * pFifo,
 TickTimeout timeout)
```

Create UDP packet from FIFO with timeout.

Constructs a `UDPPacket` by receiving data from a registered FIFO queue with a specified timeout. This constructor blocks until either a packet arrives or the timeout expires. The packet may be invalid even if the constructor returns, so **ALWAYS** call `Validate()` immediately after construction.

Parameters

|                |                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pFifo</i>   | Pointer to <code>OS_FIFO</code> queue registered with <code>RegisterUDPFifo()</code>                                                                                                                                                                                               |
| <i>timeout</i> | Timeout duration in system ticks: <ul style="list-style-type: none"> <li>0 = Non-blocking (return immediately if no packet)</li> <li>TICKS_PER_SECOND = 1 second timeout</li> <li>TICKS_PER_SECOND * N = N second timeout</li> <li>0xFFFFFFFF = Wait forever (blocking)</li> </ul> |

**Note**

**CRITICAL:** ALWAYS call [Validate\(\)](#) after construction before using packet data  
 Timeout expiration does not guarantee an invalid packet - always check with [Validate\(\)](#)  
 The FIFO must be created with [OSFifoInit\(\)](#) and registered with [RegisterUDPFifo\(\)](#)  
 This constructor blocks the calling task until packet arrives or timeout  
 For non-blocking behavior, use timeout=0 and check [Validate\(\)](#)

**Warning**

**NEVER** access packet data without calling [Validate\(\)](#) first!  
 A timeout does NOT mean the packet is invalid - must still validate  
 The FIFO must be registered before using this constructor

**Constructor vs Receive() Method:**

This constructor is equivalent to:

```
UDPPacket pkt;
pkt.Receive(pFifo, timeout);
```

However, using the [Receive\(\)](#) method in a loop is more efficient than constructing new packets repeatedly.

**FIFO Setup Requirements:**

Before using this constructor:

```
OS_FIFO udpFifo;
OSFifoInit(&udpFifo); // Initialize FIFO
RegisterUDPFifo(5000, &udpFifo); // Register on port 5000
```

**Expand for Example Usage****Examples****Example Usage - Basic Receive with Timeout:**

```
OS_FIFO udpFifo;
OSFifoInit(&udpFifo);
RegisterUDPFifo(5000, &udpFifo);

// Receive with 5 second timeout
UDPPacket pkt(&udpFifo, TICKS_PER_SECOND * 5);
if (pkt.Validate()) {
 printf("Got %d bytes from %s:%d\r\n",
 pkt.GetDataSize(),
 pkt.GetSourceAddress().ToString(),
 pkt.GetSourcePort());
 ProcessPacket(pkt);
} else {
 printf("No valid packet (timeout or corrupt)\r\n");
}
```

**Example Usage - Non-Blocking Check:**

```
// Check for packet without blocking
UDPPacket pkt(&udpFifo, 0); // timeout=0, immediate return
if (pkt.Validate()) {
 printf("Packet available!\r\n");
 ProcessPacket(pkt);
} else {
 // No packet available right now - continue other work
 DoOtherWork();
}
```

**Example Usage - Server Loop (INEFFICIENT):**

```
// INEFFICIENT - Creates new packet each iteration
while (running) {
 UDPPacket pkt(&udpFifo, TICKS_PER_SECOND); // Allocation overhead!
 if (pkt.Validate()) {
 ProcessPacket(pkt);
 }
}

// EFFICIENT - Reuse same packet object
UDPPacket pkt;
while (running) {
```

```

 if (pkt.Receive(&udpFifo, TICKS_PER_SECOND)) { // Better approach
 if (pkt.Validate()) {
 ProcessPacket(pkt);
 }
 }
 }
}

```

#### Example Usage - Heartbeat Monitoring:

```

OS_FIFO heartbeatFifo;
OSFifoInit(&heartbeatFifo);
RegisterUDPFifo(9000, &heartbeatFifo);

// Wait for heartbeat with 10 second timeout
UDPPacket hb(&heartbeatFifo, TICKS_PER_SECOND * 10);
if (hb.Validate()) {
 printf("Heartbeat received - connection alive\r\n");
 lastHeartbeat = Secs;
} else {
 printf("Heartbeat timeout - connection may be lost\r\n");
 HandleConnectionLost();
}

```

#### Example Usage - Request with Timeout:

```

// Send request
UDPPacket request;
request.SetDestinationPort(8080);
request.AddData("GET_STATUS", 10);
request.Send(serverIP);

// Wait for response with 3 second timeout
OS_FIFO responseFifo;
OSFifoInit(&responseFifo);
RegisterUDPFifo(0, &responseFifo); // Listen on any available port

UDPPacket response(&responseFifo, TICKS_PER_SECOND * 3);
if (response.Validate()) {
 printf("Response received within timeout\r\n");
 ProcessResponse(response);
} else {
 printf("Request timeout - server not responding\r\n");
 HandleTimeout();
}

```

| Scenario                | Use This Constructor? | Better Alternative                   |
|-------------------------|-----------------------|--------------------------------------|
| One-time receive        | Yes                   | N/A                                  |
| Loop with many receives | No                    | Use <a href="#">Receive()</a> method |
| Quick test/debug        | Yes                   | Convenient for testing               |
| Performance critical    | No                    | Reuse packet object                  |
| Multiple ports          | Maybe                 | Consider <a href="#">Receive()</a>   |

#### When to Use This Constructor:

#### Timeout Behavior:

- Constructor returns after timeout expires, even without packet
- [Validate\(\)](#) will return false if no packet received
- [Validate\(\)](#) may return false even if packet received (corrupted)
- Always check [Validate\(\)](#) - never assume timeout means invalid

#### See also

[Validate\(\)](#), [Receive\(\)](#), [RegisterUDPFifo\(\)](#), [OSFifoInit\(\)](#), [UDPPacket\(\)](#)

**16.184.2.2 UDPPacket()** [2/5]

```
UDPPacket::UDPPacket (
 int sock)
```

Create UDP packet from socket (blocks until data available)

Constructs a [UDPPacket](#) by receiving data from a UDP socket. This constructor blocks until data is available on the socket. **Best practice:** Use after [select\(\)](#) or [poll\(\)](#) to ensure data is ready before calling this constructor to avoid unexpected blocking.

**Parameters**

|             |                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------|
| <i>sock</i> | UDP socket descriptor from <a href="#">CreateRxUdpSocket()</a> or <a href="#">CreateRxTxUdpSocket()</a> |
|-------------|---------------------------------------------------------------------------------------------------------|

**Note**

**CRITICAL:** This constructor BLOCKS if no data is available

Use [select\(\)](#) or [poll\(\)](#) first to check if data is ready

Always call [Validate\(\)](#) after construction to verify packet integrity

The socket must be a valid UDP socket (SOCK\_DGRAM)

For non-blocking behavior, set socket to non-blocking mode first

**Warning**

Will BLOCK indefinitely if no data arrives and socket is blocking

Always use with [select\(\)/poll\(\)](#) or set socket to non-blocking mode

The socket must remain valid - don't close it while packet exists

**Recommended Pattern:**

Always use [select\(\)](#) before this constructor to avoid blocking:

1. Use [select\(\)](#) to check if data is ready
2. If data ready, construct [UDPPacket](#) (won't block)
3. Call [Validate\(\)](#) to verify packet
4. Process packet data

**Socket Creation:**

Before using this constructor, create a UDP socket:

```
// Receive-only socket
int sock = CreateRxUdpSocket(1234); // Listen on port 1234

// Or receive/transmit socket
int sock = CreateRxTxUdpSocket(1234); // Port 1234
```

**Expand for Example Usage****Examples****Example Usage - Basic with select():**

```
int sock = CreateRxUdpSocket(1234);

// Setup select() to wait for data
fd_set readfds;
FD_ZERO(&readfds);
FD_SET(sock, &readfds);

if (select(sock + 1, &readfds, NULL, NULL, NULL) > 0) {
 // Data is ready - constructor won't block
 UDPPacket pkt(sock);
 if (pkt.Validate()) {
 printf("Received packet from %s:%u\r\n",
 pkt.GetSourceAddress().ToString(),
 pkt.GetSourcePort());
 ProcessPacket(pkt);
 }
}
```

**Example Usage - With Timeout:**

```

int sock = CreateRxUdpSocket(5000);

fd_set readfds;
FD_ZERO(&readfds);
FD_SET(sock, &readfds);

// Wait up to 5 seconds for data
struct timeval tv;
tv.tv_sec = 5;
tv.tv_usec = 0;

int result = select(sock + 1, &readfds, NULL, NULL, &tv);
if (result > 0) {
 UDPPacket pkt(sock); // Data ready - won't block
 if (pkt.Validate()) {
 ProcessPacket(pkt);
 }
} else if (result == 0) {
 printf("Timeout - no data received\r\n");
} else {
 printf("Select error\r\n");
}

```

**Example Usage - Multiple Sockets:**

```

int controlSock = CreateRxUdpSocket(5000);
int dataSock = CreateRxUdpSocket(5001);

fd_set readfds;
FD_ZERO(&readfds);
FD_SET(controlSock, &readfds);
FD_SET(dataSock, &readfds);

int maxfd = (controlSock > dataSock) ? controlSock : dataSock;

if (select(maxfd + 1, &readfds, NULL, NULL, NULL) > 0) {
 if (FD_ISSET(controlSock, &readfds)) {
 UDPPacket ctrlPkt(controlSock);
 if (ctrlPkt.Validate()) {
 ProcessControlPacket(ctrlPkt);
 }
 }

 if (FD_ISSET(dataSock, &readfds)) {
 UDPPacket dataPkt(dataSock);
 if (dataPkt.Validate()) {
 ProcessDataPacket(dataPkt);
 }
 }
}

```

**Example Usage - Server Loop:**

```

int sock = CreateRxUdpSocket(8080);

while (running) {
 fd_set fds;
 FD_ZERO(&fds);
 FD_SET(sock, &fds);

 struct timeval tv = {1, 0}; // 1 second timeout

 if (select(sock + 1, &fds, NULL, NULL, &tv) > 0) {
 UDPPacket pkt(sock);
 if (pkt.Validate()) {
 IPADDR clientAddr = pkt.GetSourceAddress();
 uint16_t clientPort = pkt.GetSourcePort();

 printf("Request from %s:%u\r\n",
 clientAddr.ToString(), clientPort);

 // Send response
 UDPPacket response;
 response.SetDestinationPort(clientPort);
 response.AddData("ACK", 3);
 response.Send(clientAddr);
 }
 }

 // Timeout - check for shutdown, do housekeeping, etc.
}

```

**Example Usage - Non-Blocking Socket:**

```

int sock = CreateRxUdpSocket(6000);

// Set socket to non-blocking mode
int flags = fcntl(sock, F_GETFL, 0);
fcntl(sock, F_SETFL, flags | O_NONBLOCK);

// Now constructor won't block - returns immediately
UDPPacket pkt(sock);
if (pkt.Validate()) {
 printf("Packet received\r\n");
 ProcessPacket(pkt);
} else {
 // Either no data or invalid packet
 printf("No valid packet available\r\n");
}

```

| Approach                         | Pros                                                       | Cons                                    |
|----------------------------------|------------------------------------------------------------|-----------------------------------------|
| <b>Socket</b> (this)             | Works with <a href="#">select()</a> , standard BSD sockets | Requires <a href="#">select()</a> setup |
| <b>FIFO</b> (other constructors) | Simple, RTOS-native, efficient                             | NetBurner-specific API                  |

**Socket vs FIFO Approach:****When to Use Sockets:**

- Integrating with [select\(\)](#)-based event loops
- Porting BSD socket code to NetBurner
- Multiplexing multiple UDP ports
- Need timeout with standard timeval
- Compatibility with POSIX socket APIs

**When to Use FIFOs:**

- Pure RTOS design (no select needed)
- Higher performance (fewer layers)
- NetBurner-native applications
- Integration with other OS\_FIFO queues

**Common Mistakes:**

```

// WRONG - Will block forever if no data!
int sock = CreateRxUdpSocket(1234);
UDPPacket pkt(sock); // BLOCKS until packet arrives

// CORRECT - Check with select() first
int sock = CreateRxUdpSocket(1234);
fd_set fds;
FD_ZERO(&fds);
FD_SET(sock, &fds);
if (select(sock + 1, &fds, NULL, NULL, NULL) > 0) {
 UDPPacket pkt(sock); // Won't block - data ready
}

// ALSO CORRECT - Non-blocking socket
int sock = CreateRxUdpSocket(1234);
fcntl(sock, F_SETFL, O_NONBLOCK);
UDPPacket pkt(sock); // Returns immediately

```

**See also**

[Validate\(\)](#), [CreateRxUdpSocket\(\)](#), [CreateRxTxUdpSocket\(\)](#), [select\(\)](#), [UDPPacket\(OS\\_FIFO\\*, uint32\\_t\)](#)

**16.184.2.3 UDPPacket()** [3/5]

```
UDPPacket::UDPPacket (
 PoolPtr p)
```

Create from raw pool buffer (ADVANCED - rarely needed)

Constructs a [UDPPacket](#) by wrapping an existing pool buffer pointer. This is an advanced constructor for custom protocol implementations that work directly with the NetBurner pool buffer system. The [UDPPacket](#) takes ownership of the buffer and will automatically free it when destroyed.

**Parameters**

|          |                                                      |
|----------|------------------------------------------------------|
| <i>p</i> | Pool buffer pointer (PoolPtr) containing packet data |
|----------|------------------------------------------------------|

**Warning**

**DANGEROUS** - Incorrect use causes memory corruption, double-frees, or crashes

Only use if you fully understand the NetBurner pool buffer allocation system

The pool buffer must be properly allocated and formatted

[UDPPacket](#) assumes FULL OWNERSHIP - do not free the buffer elsewhere

After passing to [UDPPacket](#), the original PoolPtr should not be used

**Note**

This constructor is for EXPERT USE ONLY

Most applications should use [UDPPacket\(\)](#) or [UDPPacket\(bool\)](#) instead

Required for custom protocol stacks or low-level network code

The buffer must contain valid UDP/IP headers in the correct format

**When This Constructor Is Needed:**

- Implementing custom network protocols below UDP level
- Interfacing with raw network drivers
- Zero-copy optimizations in performance-critical code
- Custom packet inspection/modification tools
- Working with network hardware at buffer level

**Prerequisites:**

Before using this constructor, you must understand:

- NetBurner pool buffer allocation (GetBuffer/FreeBuffer)
- UDP/IP packet header structures
- Buffer ownership and lifecycle management
- Memory alignment requirements
- Reference counting semantics

**Buffer Ownership Rules:**

```
PoolPtr buf = AllocatePoolBuffer(); // You own buffer
// ... format buffer with UDP/IP headers ...

UDPPacket pkt(buf); // UDPPacket now owns buffer
// DO NOT use 'buf' anymore - ownership transferred!
// DO NOT call FreeBuffer(buf) - UDPPacket will do it

// When pkt goes out of scope or is destroyed, buffer is freed
```

**Expand for Example Usage****Examples**

**Example Usage - Custom Protocol (Expert Level):**

```
// ADVANCED EXAMPLE - Only for experts!
PoolPtr CreateCustomUDPPacket(const uint8_t* data, uint16_t len) {
 // Allocate buffer from pool
 PoolPtr buf = GetBuffer();
 if (!buf) {
 return nullptr;
 }

 // Manually construct UDP/IP headers
 uint8_t* pData = (uint8_t*)buf->pData;

 // IP header setup (simplified - actual code more complex)
 struct IPHeader* ipHdr = (struct IPHeader*)pData;
 ipHdr->version = 4;
 ipHdr->protocol = UDP_PROTOCOL;
 // ... more header fields ...

 // UDP header setup
 struct UDPHeader* udpHdr = (struct UDPHeader*)(pData + IP_HEADER_SIZE);
 udpHdr->srcPort = htons(5000);
 udpHdr->dstPort = htons(6000);
 udpHdr->length = htons(len + UDP_HEADER_SIZE);
 // ... checksum calculation ...

 // Copy payload
 memcpy(pData + IP_HEADER_SIZE + UDP_HEADER_SIZE, data, len);

 return buf; // Caller takes ownership
}

void SendCustomPacket() {
 uint8_t payload[] = "Custom data";
 PoolPtr buf = CreateCustomUDPPacket(payload, sizeof(payload));

 if (buf) {
 UDPPacket pkt(buf); // Wrap buffer - takes ownership
 // pkt will auto-free buffer when destroyed

 // Can still use normal UDPPacket methods
 printf("Packet size: %u\r\n", pkt.GetDataSize());
 }
}
```

**Example Usage - Raw Packet Inspection:**

```
// Intercept packets at low level for inspection
void InspectRawPacket(PoolPtr rawBuffer) {
 // Create temporary packet wrapper for inspection
 // Note: This takes ownership of rawBuffer!
 UDPPacket pkt(rawBuffer);

 printf("Source: %s:%u\r\n",
 pkt.GetSourceAddress().ToString(),
 pkt.GetSourcePort());
 printf("Destination: %s:%u\r\n",
 pkt.GetDestinationAddress().ToString(),
 pkt.GetDestinationPort());
 printf("Data size: %u bytes\r\n", pkt.GetDataSize());

 // Buffer will be freed when pkt goes out of scope
}
```

**Common Mistakes to Avoid:**

```
// WRONG - Double free!
PoolPtr buf = GetBuffer();
UDPPacket pkt(buf);
FreeBuffer(buf); // CRASH - pkt already owns it!

// WRONG - Using buffer after transfer
PoolPtr buf = GetBuffer();
UDPPacket pkt(buf);
buf->pData[0] = 0xFF; // UNDEFINED - pkt owns buffer now!

// WRONG - Uninitialized buffer
PoolPtr buf = GetBuffer();
UDPPacket pkt(buf); // CRASH - no valid UDP/IP headers!

// CORRECT - Proper ownership transfer
PoolPtr buf = CreateValidPacketBuffer();
UDPPacket pkt(buf); // Clean transfer
// Don't touch buf anymore
```

For Most Applications:

**You should NOT use this constructor.** Use these instead:

- `UDPPacket()` - Standard packet creation
- `UDPPacket(bool)` - IPv4/IPv6 packet creation

See also

`UDPPacket()`, `UDPPacket(bool)`, `PoolPtr`, `GetBuffer()`, `FreeBuffer()`

#### 16.184.2.4 UDPPacket() [4/5]

```
UDPPacket::UDPPacket (
 UDPPacket & pkt)
```

Move constructor - transfers ownership.

Constructs a new `UDPPacket` by moving resources from an existing packet. The source packet transfers ownership of its internal buffers and state to the new packet. After the move, the source packet becomes invalid and should not be used.

Parameters

|            |                                                  |
|------------|--------------------------------------------------|
| <i>pkt</i> | Source packet to move from (will be invalidated) |
|------------|--------------------------------------------------|

Note

Source packet becomes INVALID after move - do not use it!

This is a move operation, not a copy - no data duplication occurs

Useful for returning packets from functions efficiently

No memory allocation or copying happens - just ownership transfer

The source packet should be considered destroyed after the move

Move Semantics:

After construction:

- **New packet:** Has all data and state from source
- **Source packet:** Empty/invalid state, should not be accessed

Typical Use Cases:

- Returning `UDPPacket` from a function without copying
- Transferring packet ownership between objects
- Building packets in helper functions
- Factory pattern implementations
- Avoiding unnecessary buffer copies

---

#### Expand for Example Usage

##### Examples

Example Usage - Return from Function:

```
// Build a packet and return it efficiently (no copy)
UDPPacket CreateStatusPacket(uint32_t statusCode) {
 UDPPacket pkt;
 pkt.SetDestinationPort(8080);
 pkt.AddDataWord(statusCode);
 pkt.AddData("Status update", 13);

 return pkt; // Move constructor called automatically
}

void SendStatus() {
 UDPPacket statusPkt = CreateStatusPacket(200); // Moved, not copied
 statusPkt.Send(serverIP);
}
```

**Example Usage - Packet Factory Pattern:**

```

class PacketBuilder {
public:
 // Returns packet by move - efficient
 UDPPacket BuildHeartbeat(uint32_t sequence) {
 UDPPacket pkt;
 pkt.SetDestinationPort(5000);
 pkt.AddDataByte(0x01); // Heartbeat type
 pkt.AddDataWord(sequence);
 pkt.AddDataWord(Secs); // Timestamp
 return pkt; // Move constructor invoked
 }

 UDPPacket BuildDataPacket(const uint8_t* data, uint16_t len) {
 UDPPacket pkt;
 pkt.SetDestinationPort(5001);
 pkt.AddDataByte(0x02); // Data type
 pkt.AddData((uint8_t*)data, len);
 return pkt; // Move constructor invoked
 }
};

void SendPackets() {
 PacketBuilder builder;

 UDPPacket hb = builder.BuildHeartbeat(42); // Moved
 hb.Send(serverIP);

 uint8_t data[] = {1, 2, 3, 4};
 UDPPacket dp = builder.BuildDataPacket(data, 4); // Moved
 dp.Send(serverIP);
}

```

**Example Usage - Conditional Packet Building:**

```

UDPPacket PreparePacket(bool urgent) {
 UDPPacket pkt;

 if (urgent) {
 pkt.SetDSCP(46); // Expedited Forwarding
 pkt.SetDestinationPort(9000);
 pkt.AddData("URGENT", 6);
 } else {
 pkt.SetDSCP(0); // Best effort
 pkt.SetDestinationPort(9001);
 pkt.AddData("NORMAL", 6);
 }

 return pkt; // Move constructor - no copy overhead
}

void ProcessAlert(bool isUrgent) {
 UDPPacket alertPkt = PreparePacket(isUrgent); // Efficient move
 alertPkt.Send(monitorIP);
}

```

**Example Usage - Packet Queue Transfer:**

```

// Transfer packets between queues efficiently
void MovePacketToQueue(UDPPacket& sourcePkt, std::vector<UDPPacket>& queue) {
 UDPPacket movedPkt(sourcePkt); // Move constructor
 queue.push_back(movedPkt);

 // sourcePkt is now invalid - don't use it!
}

```

**Performance Benefits:**

```

// WITHOUT move constructor (hypothetical copy)
UDPPacket CreatePacket() {
 UDPPacket pkt;
 pkt.AddData(largeBuffer, 1024);
 return pkt; // Would copy 1024+ bytes!
}

// WITH move constructor (actual behavior)
UDPPacket CreatePacket() {
 UDPPacket pkt;
 pkt.AddData(largeBuffer, 1024);
 return pkt; // Just transfers pointer - fast!
}

```

**What Happens During Move:**

1. New packet receives all internal pointers from source
2. New packet receives all state (ports, addresses, data size)
3. Source packet's pointers are set to NULL/invalid
4. Source packet should not be accessed after move
5. No memory copying or allocation occurs

**Warning**

**CRITICAL:** After move, the source packet is INVALID

```
UDPPacket pkt1;
pkt1.AddData("Hello", 5);

UDPPacket pkt2(pkt1); // Move from pkt1 to pkt2

// SAFE - pkt2 has the data
pkt2.Send(serverIP);

// UNSAFE - pkt1 is now invalid!
pkt1.Send(serverIP); // UNDEFINED BEHAVIOR!
```

**Compiler Optimization:**

Modern compilers often use Return Value Optimization (RVO) or Named Return Value Optimization (NRVO) to eliminate even the move constructor call, constructing the return value directly in the caller's location. The move constructor exists as a fallback when such optimizations can't be applied.

**See also**

UDPPacket(), UDPPacket(bool), Send(), AddData()

**16.184.2.5 UDPPacket() [5/5]**

```
UDPPacket::UDPPacket (
 bool bIsIpv6 = false)
```

Construct a new UDP packet object.

Creates a UDP packet object that can be used for sending or receiving UDP data. The packet is allocated with appropriate buffer space and initialized for either IPv4 or IPv6 operation.

**Parameters**

|                |                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>bIsIpv6</i> | IP version selector: <ul style="list-style-type: none"> <li>• false = IPv4 packet (default, most common)</li> <li>• true = IPv6 packet (128-bit addresses)</li> </ul> |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note**

The default is IPv4 (bIsIpv6=false) which is appropriate for most applications

For received packets, the IP version is automatically detected regardless of constructor parameter

The same UDPPacket object can be reused for multiple send/receive operations

Memory is allocated during construction - consider reusing packets in loops

**When to Use IPv6:**

- Your network infrastructure requires IPv6 addressing
- Communicating with IPv6-only hosts
- Future-proofing for IPv6 transition
- Link-local communication using fe80:: addresses

| Feature        | IPv4 (false)        | IPv6 (true)               |
|----------------|---------------------|---------------------------|
| Address Size   | 32-bit (4 bytes)    | 128-bit (16 bytes)        |
| Address Format | 192.168.1.100       | fe80::1234:5678:abcd:ef01 |
| Header Size    | 20 bytes minimum    | 40 bytes minimum          |
| Typical Use    | Most networks today | Modern/future networks    |

**IPv4 vs IPv6 Considerations:****Expand for Example Usage****Examples****Example Usage - Basic IPv4 Packet (Default):**

```
// Create IPv4 packet (most common case)
UDPPacket pkt; // IPv4 by default
pkt.SetDestinationPort(8080);
pkt.AddData("Hello", 5);
pkt.Send(serverIP);
```

**Example Usage - Explicit IPv4:**

```
// Explicitly specify IPv4
UDPPacket pkt(false);
pkt.SetSourcePort(5000);

while (running) {
 if (pkt.Receive(&fifo, TICKS_PER_SECOND)) {
 if (pkt.Validate()) {
 ProcessIPv4Packet(pkt);
 }
 }
}
```

**Example Usage - IPv6 Packet:**

```
// Create IPv6 packet for modern networks
UDPPacket pkt(true); // IPv6 mode

// IPv6 address example
IPADDR ipv6Addr;
ipv6Addr.SetFromAscii("fe80::1234:5678:abcd:ef01");

pkt.SetDestinationPort(9000);
pkt.AddData("IPv6 Data", 9);
pkt.Send(ipv6Addr);
```

**Example Usage - Dual-Stack Application:**

```
// Support both IPv4 and IPv6
void ProcessPackets(OS_FIFO *fifo, bool useIPv6) {
 UDPPacket pkt(useIPv6); // Construct with appropriate version

 while (running) {
 if (pkt.Receive(fifo, TICKS_PER_SECOND)) {
 if (pkt.Validate()) {
 // Check actual packet type
 if (pkt.bIsIPv6()) {
 printf("IPv6 packet received\r\n");
 } else {
 printf("IPv4 packet received\r\n");
 }
 ProcessPacket(pkt);
 }
 }
 }
}
```

```

 }

 // In main application
 if (networkSupportsIPv6()) {
 ProcessPackets(&fifo, true); // IPv6
 } else {
 ProcessPackets(&fifo, false); // IPv4
 }
}

```

#### Example Usage - Efficient Packet Reuse:

```

// Create packet once, reuse many times (recommended pattern)
UDPPacket pkt; // IPv4 packet

// Send multiple messages efficiently
for (int i = 0; i < 100; i++) {
 pkt.ResetData(); // Clear previous data
 pkt.AddDataWord(i);
 pkt.AddData("Message", 7);
 pkt.Send(destIP, destPort);
 OSTimeDly(TICKS_PER_SECOND);
}

// Same packet object can also receive
while (running) {
 if (pkt.Receive(&fifo, TICKS_PER_SECOND * 5)) {
 if (pkt.Validate()) {
 ProcessResponse(pkt);
 }
 }
}

```

#### Performance Tip:

For high-performance applications, create the [UDPPacket](#) object once outside your main loop and reuse it:

```

// INEFFICIENT - Creates/destroys packet each iteration
while (running) {
 UDPPacket pkt; // Allocation overhead!
 if (pkt.Receive(&fifo, timeout)) {
 // process
 }
}

// EFFICIENT - Create once, reuse many times
UDPPacket pkt; // Allocated once
while (running) {
 if (pkt.Receive(&fifo, timeout)) {
 // process (much faster!)
 }
}

```

#### Warning

For received packets, the IP version is determined by the incoming packet, not by the constructor parameter. Use [blsIPv6\(\)](#) to check received packet type.

#### See also

[blsIPv6\(\)](#), [Receive\(\)](#), [Send\(\)](#), [ResetData\(\)](#)

#### 16.184.2.6 ~UDPPacket()

```
UDPPacket::~UDPPacket ()
```

Destructor - automatically frees pool buffer.

Destructor that automatically releases the UDP packet's pool buffer back to the system memory pool. This implements RAII (Resource Acquisition Is Initialization) principles, ensuring proper cleanup without manual memory management.

#### Note

**Automatic cleanup** - Called automatically when packet goes out of scope

**No manual calls needed** - Never call this destructor directly

**Exception-safe** - Cleanup happens even if exceptions occur

**Pool buffer release** - Returns buffer to pool for reuse

**Warning**

If `Send()` was already called, the buffer is already freed - destructor handles this  
 Do not access packet data after the `UDPPacket` object is destroyed  
 Buffer is NOT freed if `SendAndKeep()` was the last send operation

**RAII Benefits:**

Resource Acquisition Is Initialization provides automatic memory management:

- **Allocation:** Constructor allocates pool buffer
- **Usage:** Packet methods use the buffer
- **Cleanup:** Destructor automatically frees buffer
- **Safety:** No memory leaks even with exceptions

**When Destructor Runs:**

The destructor is automatically called when:

- `UDPPacket` goes out of scope
- `UDPPacket` is explicitly deleted
- Function returns (for local variables)
- Exception is thrown (stack unwinding)
- Container is destroyed (if packet in vector, etc.)

**Memory Management Cases:**

The destructor handles different memory states correctly:

**Case 1: Buffer never sent**

```
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 // Destructor frees buffer when pkt goes out of scope
}
```

**Case 2: Buffer sent with `Send()`**

```
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 pkt.Send(destIP); // Buffer already freed here
 // Destructor sees buffer is NULL, does nothing
}
```

**Case 3: Buffer sent with `SendAndKeep()`**

```
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 pkt.SendAndKeep(dest1); // Buffer retained
 pkt.SendAndKeep(dest2); // Buffer still retained
 // Destructor frees buffer when pkt goes out of scope
}
```

**Case 4: Exception safety**

```
try {
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 ThrowException(); // Exception thrown
 // Destructor still called during stack unwinding - no leak
} catch (...) {
 // Buffer already cleaned up by destructor
}
```

**Performance Considerations:**

- **Fast operation:** Simply returns buffer to pool
- **No system calls:** Pure memory pool operation
- **O(1) complexity:** Constant time release
- **Thread-safe:** Pool operations are synchronized

**Expand for Example Usage****Examples**

**Common Patterns:**

```

// Pattern 1: Local scope (most common)
void SendMessage() {
 UDPPacket pkt; // Constructor allocates
 pkt.AddData("Message", 7);
 pkt.Send(serverIP);
} // Destructor called here - automatic cleanup

// Pattern 2: Early cleanup with explicit scope
void ProcessData() {
 {
 UDPPacket pkt;
 pkt.Receive(&fifo, timeout);
 ProcessPacket(pkt);
 } // Buffer freed here, before other work

 DoOtherWork(); // More memory available
}

// Pattern 3: Container of packets
void ManagePackets() {
 std::vector<UDPPacket> packets;
 packets.emplace_back(); // Constructor called
 packets.clear(); // Destructors called for all
}

// Pattern 4: Dynamic allocation (less common)
void DynamicPacket() {
 UDPPacket* pkt = new UDPPacket();
 pkt->AddData("Hello", 5);
 delete pkt; // Explicit destructor call
}

```

**Destructor vs Send():**

Understanding when memory is freed:

| Operation      | Buffer State After | Destructor Action    |
|----------------|--------------------|----------------------|
| Send()         | Freed immediately  | None (already freed) |
| SendAndKeep()  | Retained           | Frees on destruction |
| No send        | Allocated          | Frees on destruction |
| Receive() only | Allocated          | Frees on destruction |

**Fragment Buffer Handling:**

```

#ifdef UDP_FRAGMENTS
// For fragmented packets, destructor calls FragFreeBuffer()
// instead of normal FreeBuffer() - handles reassembly cleanup
#endif

```

**Internal Implementation:**

The destructor performs these steps:

1. Check if pool buffer pointer (m\_p) is non-NULL
2. If fragment buffer, call FragFreeBuffer()
3. Otherwise, call FreeBuffer()
4. Set internal pointers to NULL
5. IPv6 cleanup if compiled with IPv6 support

**Best Practices:**

- **Let it work automatically** - Don't call destructor manually
- **Use local variables** - Simplest and safest pattern
- **Minimize lifetime** - Use explicit scopes for early cleanup
- **Avoid new/delete** - Prefer stack allocation
- **Trust RAII** - Don't second-guess automatic cleanup

**What NOT To Do:**

```
// WRONG: Explicit destructor call
UDPPacket pkt;
pkt.~UDPPacket(); // NEVER DO THIS!

// WRONG: Accessing after scope
UDPPacket* ptr;
{
 UDPPacket pkt;
 ptr = &pkt;
} // pkt destroyed here
ptr->Send(ip); // CRASH: Accessing destroyed object

// WRONG: Double-delete
UDPPacket* pkt = new UDPPacket();
delete pkt;
delete pkt; // CRASH: Double-free
```

**Debug Information:**

In debug builds, the destructor may:

- Log destructor calls
- Validate buffer state
- Check for memory corruption
- Track pool statistics

**Warning**

**Critical:** Never manually call the destructor unless you know exactly what you're doing

The destructor is called automatically - manual calls cause double-free bugs

**See also**

UDPPacket(), [Send\(\)](#), [SendAndKeep\(\)](#), [FreeBuffer\(\)](#), PoolPtr

**16.184.3 Member Function Documentation****16.184.3.1 AddData() [1/2]**

```
void UDPPacket::AddData (
 PCSTR pData)
```

Add null-terminated string (includes NULL in packet)

Appends a null-terminated string to the packet, including the terminating NULL character. This is convenient for string-based protocols where the receiver expects NULL-terminated strings.

**Parameters**

|              |                                          |
|--------------|------------------------------------------|
| <i>pData</i> | Pointer to null-terminated string to add |
|--------------|------------------------------------------|

**Note**

The NULL terminator IS included in the packet data

String length is automatically calculated using strlen()

Data size is incremented by (strlen(pData) + 1)

**Warning**

pData must be a valid null-terminated string

For binary data that may contain NULL bytes, use [AddData\(puint8\\_t, uint16\\_t\)](#)

**Example Usage:**

```
UDPPacket pkt;
pkt.AddData("HELLO"); // Adds 6 bytes: 'H','E','L','L','O','\0'
pkt.AddData("WORLD"); // Adds 6 bytes: 'W','O','R','L','D','\0'
// Packet now contains: "HELLO\0WORLD\0" (12 bytes total)
```

**See also**

[AddData\(puint8\\_t, uint16\\_t\)](#), [GetDataSize\(\)](#)

**16.184.3.2 AddData() [2/2]**

```
void UDPPacket::AddData (
 puint8_t pData,
 uint16_t len)
```

Add binary data (auto-updates size - no [SetDataSize\(\)](#) needed)

Appends binary data to the packet buffer and automatically updates the internal data size counter. This is the primary method for building packets with structured data.

**Parameters**

|              |                                    |
|--------------|------------------------------------|
| <i>pData</i> | Pointer to the binary data to add  |
| <i>len</i>   | Number of bytes to copy from pData |

**Note**

The data size is automatically incremented by len

No manual call to [SetDataSize\(\)](#) is required

Data is appended to the end of existing packet data

**Warning**

Ensure pData points to at least len valid bytes

No bounds checking - caller must ensure packet has space

**Example Usage:**

```
struct SensorData {
 uint32_t timestamp;
 float temperature;
 float humidity;
} data;

UDPPacket pkt;
uint8_t header[] = {0xAA, 0xBB, 0x01};
pkt.AddData(header, sizeof(header));
pkt.AddData((puint8_t)&data, sizeof(data));
pkt.Send(destIP, destPort);
```

**See also**

[AddData\(PCSTR\)](#), [AddDataWord\(\)](#), [AddDataByte\(\)](#), [GetDataSize\(\)](#)

**16.184.3.3 AddDataByte()**

```
void UDPPacket::AddDataByte (
 uint8_t b)
```

Add 8-bit value.

Appends a single byte to the packet. Useful for adding flags, command codes, or single-byte values to packet data.

## Parameters

|          |                            |
|----------|----------------------------|
| <i>b</i> | 8-bit value to add (0-255) |
|----------|----------------------------|

## Note

Increments data size by 1 byte

No byte order conversion needed (single byte)

## Example Usage:

```
UDPPacket pkt;
pkt.AddDataByte(0x01); // Command code
pkt.AddDataByte(0xFF); // Flag value
pkt.AddDataByte(42); // Numeric value
```

## See also

[AddDataWord\(\)](#), [AddData\(puint8\\_t, uint16\\_t\)](#)

**16.184.3.4 AddDataWord()**

```
void UDPPacket::AddDataWord (
 uint16_t w)
```

Add 16-bit value.

Appends a 16-bit word to the packet in network byte order (big-endian). Useful for adding integer values, ports, or length fields to packets.

## Parameters

|          |                               |
|----------|-------------------------------|
| <i>w</i> | 16-bit value to add (0-65535) |
|----------|-------------------------------|

## Note

Value is automatically converted to network byte order if needed

Increments data size by 2 bytes

Equivalent to `AddData((puint8_t)&w, 2)` with byte order conversion

## Example Usage:

```
UDPPacket pkt;
pkt.AddDataWord(0x1234); // Adds 2 bytes: 0x12, 0x34 (big-endian)
pkt.AddDataWord(8080); // Adds port number
```

## See also

[AddDataByte\(\)](#), [AddData\(puint8\\_t, uint16\\_t\)](#)

**16.184.3.5 bIsIPv6()**

```
bool UDPPacket::bIsIPv6 () const [inline]
```

Check if packet uses IPv6 addressing.

Determines whether this packet is using IPv6 or IPv4 addressing by checking if the internal IPv6 header pointer is set. Returns true for IPv6 packets, false for IPv4 packets.

## Returns

true if packet is IPv6, false if packet is IPv4

**Note**

This is a const function and does not modify the packet

The check is performed by testing if m\_pIPv6f (IPv6 header pointer) is NULL

Use this before making IP version-specific operations

**Why Check IP Version?**

- IPv6 addresses are 128-bit vs IPv4's 32-bit
- Some protocols behave differently on IPv6
- MTU and fragmentation differ between versions
- Useful for logging and debugging
- May need different processing for IPv4 vs IPv6

**Expand for Example Usage****Examples**

Example Usage:

```
UDPPacket pkt;
if (pkt.Receive()) {
 IPADDR source = pkt.GetSourceAddress();

 if (pkt.bIsIPv6()) {
 printf("IPv6 packet from: %s\r\n", source.ToString());
 ProcessIPv6Specific(pkt);
 } else {
 printf("IPv4 packet from: %s\r\n", source.ToString());
 ProcessIPv4Specific(pkt);
 }
}

// Conditional packet handling
if (!pkt.bIsIPv6() && requireIPv6Only) {
 printf("Rejecting IPv4 packet on IPv6-only interface\r\n");
 return;
}
```

**See also**

[GetSourceAddress\(\)](#), [GetDestinationAddress\(\)](#), [IPADDR::IsIPv6\(\)](#)

**16.184.3.6 GetDataBuffer()**

```
uint8_t UDPPacket::GetDataBuffer (
 bool bReAllocateIfNeeded = false)
```

Get data buffer pointer for reading or writing.

**CRITICAL: After writing, MUST call [SetDataSize\(\)](#) before sending!**

```
// Writing (sprintf method - recommended for text):
uint16_t len = sprintf(pkt.GetDataBuffer(), "Value: %d", val);
pkt.SetDataSize(len); // REQUIRED!
```

```
// Reading (received packets):
uint8_t data = pkt.GetDataBuffer();
uint16_t len = pkt.GetDataSize();
for (int i = 0; i < len; i++) { process(data[i]); }
```

**16.184.3.7 GetDataSize()**

```
uint16_t UDPPacket::GetDataSize (
 void) const
```

Get current data size in bytes.

Returns the number of bytes currently stored in the packet's data buffer. This reflects the actual data length, not the buffer capacity.

**Returns**

Current data size in bytes (0 to maximum packet size)

**Note**

This is a const function and does not modify the packet state

The returned size includes all data added via [AddData\(\)](#) methods

**Example Usage:**

```
UDPPacket packet;
packet.AddData("Test", 4);
uint16_t size = packet.GetDataSize(); // Returns 4
```

**See also**

[ResetData\(\)](#), [AddData\(\)](#)

**16.184.3.8 GetDestinationAddress()**

```
IPADDR UDPPacket::GetDestinationAddress (
 void) [inline]
```

Get destination IP address of the packet.

Returns the destination IP address from the packet header. For received packets, this is YOUR local interface address that received the packet (useful for multi-homed devices). For outgoing packets, this is the target remote address.

**Returns**

IPADDR object containing the destination address (IPv4 or IPv6)

**Note**

This function wraps [GetDestinationAddress6\(\)](#) for unified IPv4/IPv6 handling

For received packets: returns YOUR local IP that received it

For sent packets: returns the remote target IP you're sending to

Useful for determining which interface received a packet

**Understanding Address Roles:****For Received Packets:**

- [GetSourceAddress\(\)](#) = Remote sender's IP
- [GetDestinationAddress\(\)](#) = Your local IP

**For Sent Packets:**

- [GetSourceAddress\(\)](#) = Your local IP
- [GetDestinationAddress\(\)](#) = Remote target's IP

**Example Usage:**

```
UDPPacket pkt;
if (pkt.Receive()) {
 IPADDR myAddr = pkt.GetDestinationAddress();
 IPADDR senderAddr = pkt.GetSourceAddress();

 // Useful for multi-homed devices
 if (myAddr == primaryInterface) {
 ProcessPrimaryNetwork(pkt);
 } else if (myAddr == managementInterface) {
 ProcessManagementNetwork(pkt);
 }

 printf("Packet from %s to my interface %s\r\n",
 senderAddr.ToString(),
 myAddr.ToString());
}
```

**See also**

[GetSourceAddress\(\)](#), [GetDestinationPort\(\)](#), [GetDestinationAddress6\(\)](#)

### 16.184.3.9 GetDestinationPort()

```
uint16_t UDPPacket::GetDestinationPort (
 void) const
```

Get destination port (for received packets: local port that received it)

For outgoing packets, returns the destination port set by [SetDestinationPort\(\)](#). For received packets, returns the LOCAL port that received the packet (i.e., which port on YOUR device the packet was addressed to).

#### Returns

Port number (1-65535)

#### Note

For received packets, this is YOUR listening port, not the sender's port

To get the sender's port on received packets, use [GetSourcePort\(\)](#)

This is a const function and does not modify the packet

#### Understanding Port Roles in Received Packets:

When you receive a UDP packet:

- [GetDestinationPort\(\)](#) = Your local port (where you're listening)
- [GetSourcePort\(\)](#) = Remote sender's port (where they sent from)

#### Example Usage:

```
// Receiving on multiple ports
UDPPacket pkt;
if (pkt.Receive()) {
 uint16_t myPort = pkt.GetDestinationPort();
 uint16_t theirPort = pkt.GetSourcePort();

 if (myPort == 5000) {
 ProcessControlPacket(pkt);
 } else if (myPort == 5001) {
 ProcessDataPacket(pkt);
 }

 // Reply to sender
 UDPPacket reply;
 reply.SetDestinationPort(theirPort);
 reply.Send(pkt.GetSourceAddress());
}
```

[SetDestinationPort\(\)](#), [GetSourcePort\(\)](#), [GetSourceAddress\(\)](#)

### 16.184.3.10 GetDSCP()

```
uint8_t UDPPacket::GetDSCP (
 void) const
```

Get DSCP value (0-63)

Returns the Differentiated Services Code Point (DSCP) value from the packet's IP header. DSCP is used for Quality of Service (QoS) classification and traffic prioritization in IP networks.

#### Returns

DSCP value in range 0-63

- 0 = Best Effort (default)
- 46 = Expedited Forwarding (EF) - low latency
- 10,12,14 = Assured Forwarding (AF) classes
- See RFC 2474 for complete DSCP definitions

**Note**

This is a const function and does not modify the packet

DSCP occupies the upper 6 bits of the IP TOS/Traffic Class field

Not all networks honor DSCP markings - depends on router configuration

| Value | Name | Description                 |
|-------|------|-----------------------------|
| 0     | CS0  | Best Effort (default)       |
| 8     | CS1  | Low Priority                |
| 46    | EF   | Expedited Forwarding (VoIP) |
| 34    | AF41 | High Priority Data          |
| 26    | AF31 | Medium Priority Data        |

**Common DSCP Values:****Example Usage:**

```
UDPPacket packet;
// ... receive packet ...
uint8_t dscp = packet.GetDSCP();
if (dscp == 46) {
 printf("High priority packet (EF)\r\n");
} else if (dscp == 0) {
 printf("Best effort packet\r\n");
}
```

**See also**

[SetDSCP\(\)](#), [RFC 2474 \(DSCP\)](#), [RFC 2475 \(DiffServ Architecture\)](#)

**16.184.3.11 GetMacSource()**

```
MACADDR UDPPacket::GetMacSource ()
```

Get sender's MAC address (link-layer identification)

Returns the source MAC address from the Ethernet frame header. This is the hardware address of the last-hop device that transmitted the packet on the local network segment.

**Returns**

[MACADDR](#) object containing the 6-byte MAC address

**Warning**

The returned MAC may be a router's MAC, not the original sender's MAC, if the packet crossed subnet boundaries. Use [GetSourceAddress\(\)](#) for end-to-end identification.

**Note**

Only valid for received packets - undefined for packets not yet sent

MAC address is Link Layer (Layer 2) - only valid on local network segment

For packets from remote subnets, this is the default gateway's MAC

Different from IP source address which identifies the original sender

| Attribute | MAC Address            | IP Address                   |
|-----------|------------------------|------------------------------|
| Scope     | Local network only     | End-to-end (across networks) |
| Identity  | Last-hop device        | Original source device       |
| Routing   | Changes at each router | Remains constant             |
| Use Case  | Link-layer filtering   | Application identification   |

### Understanding MAC vs IP Addresses:

#### Common Use Cases:

- **Device Whitelisting:** Allow only known MAC addresses
- **Local Network Detection:** Identify devices on same subnet
- **ARP Table Management:** Correlate IP to MAC mappings
- **Security Filtering:** MAC-based access control
- **Diagnostics:** Verify correct router/gateway MAC

### Expand for Example Usage

#### Examples

##### Example Usage - Basic MAC Display:

```
UDPPacket pkt;
if (pkt.Receive()) {
 MACADR mac = pkt.GetMacSource();
 printf("From MAC: %02X:%02X:%02X:%02X:%02X:%02X\r\n",
 mac.bytes[0], mac.bytes[1], mac.bytes[2],
 mac.bytes[3], mac.bytes[4], mac.bytes[5]);
}
```

##### Example Usage - MAC-Based Filtering:

```
// Whitelist of allowed MACs
const MACADR trustedDevices[] = {
 {{0x00, 0x03, 0xF4, 0x12, 0x34, 0x56}}, // Device 1
 {{0x00, 0x03, 0xF4, 0x78, 0x9A, 0xBC}} // Device 2
};

UDPPacket pkt;
if (pkt.Receive()) {
 MACADR sourceMac = pkt.GetMacSource();
 bool trusted = false;

 for (int i = 0; i < sizeof(trustedDevices)/sizeof(MACADR); i++) {
 if (memcmp(&sourceMac, &trustedDevices[i], sizeof(MACADR)) == 0) {
 trusted = true;
 break;
 }
 }

 if (trusted) {
 ProcessPacket(pkt);
 } else {
 printf("Rejected packet from untrusted MAC\r\n");
 }
}
```

##### Example Usage - Detecting Local vs Remote Packets:

```
UDPPacket pkt;
if (pkt.Receive()) {
 MACADR sourceMac = pkt.GetMacSource();
 MACADR gatewayMac = GetDefaultGatewayMAC(); // Your function

 if (memcmp(&sourceMac, &gatewayMac, sizeof(MACADR)) == 0) {
 printf("Packet came through router (remote subnet)\r\n");
 } else {
 printf("Packet from device on local subnet\r\n");
 }
}
```

**MAC Address Format:**

The [MACADR](#) structure contains 6 bytes (48 bits):

- Bytes 0-2: OUI (Organizationally Unique Identifier) - manufacturer ID
- Bytes 3-5: NIC (Network Interface Controller) - device-specific
- Example: 00:03:F4 = NetBurner OUI

**See also**

[GetSourceAddress\(\)](#), [GetMacDestination\(\)](#), [MACADR](#)

**16.184.3.12 GetPacketId()**

```
uint16_t UDPPacket::GetPacketId (
 void)
```

Get IP packet ID (used for fragment reassembly and packet tracking)

Returns the IP packet identification field from the IP header. This value is used by the network stack for IP fragmentation/reassembly and can be used by applications for packet tracking and debugging.

**Returns**

16-bit packet ID value (0-65535)

- Unique (or semi-unique) identifier for this IP packet
- Typically increments for each packet sent
- Same ID used for all fragments of a fragmented packet

**Note**

The packet ID is automatically assigned by the network stack for sent packets

For received packets, reflects the ID assigned by the sender

Not guaranteed to be globally unique - only useful within a short time window

**Common Use Cases:**

- **Fragment Reassembly:** Matching fragments of the same original packet
- **Packet Tracking:** Correlating packets in logs and network captures
- **Debugging:** Identifying specific packets in network analysis
- **Duplicate Detection:** Identifying retransmitted packets

**Example Usage:**

```
UDPPacket pkt;
pkt.AddData("Test", 4);
pkt.Send(destIP, destPort);

uint16_t packetId = pkt.GetPacketId();
printf("Sent packet with ID: %u\r\n", packetId);

// Later, when receiving response
UDPPacket response;
if (response.Receive()) {
 uint16_t responseId = response.GetPacketId();
 printf("Received packet with ID: %u\r\n", responseId);
}
```

**Warning**

Do not use packet ID as a reliable sequence number - use application-level sequencing

Packet IDs may wrap around after 65535 packets

**See also**

RFC 791 (IP), RFC 815 (IP Reassembly)

### 16.184.3.13 GetSourceAddress()

```
IPADDR UDPPacket::GetSourceAddress (
 void) [inline]
```

Get source IP address of the packet.

Returns the source IP address from the packet header. For received packets, this is the address of the remote sender. For outgoing packets, this is the local interface address used to send the packet.

#### Returns

IPADDR object containing the source address (IPv4 or IPv6)

#### Note

This function wraps GetSourceAddress6() for unified IPv4/IPv6 handling

The returned IPADDR type supports both IPv4 and IPv6 addresses

For received packets, use this to determine who sent the packet

For sent packets, this reflects which local interface was used

#### Typical Use Cases:

- Identifying the sender of a received packet
- Validating packets are from expected sources
- Building reply packets to the correct address
- Logging packet sources for debugging

#### Example Usage:

```
UDPPacket pkt;
if (pkt.Receive()) {
 IPADDR senderAddr = pkt.GetSourceAddress();
 uint16_t senderPort = pkt.GetSourcePort();

 printf("Received from %s:%u\r\n",
 senderAddr.IsIPv6() ? "IPv6" : "IPv4",
 senderPort);

 // Send reply back to sender
 UDPPacket reply;
 reply.AddData("ACK", 3);
 reply.SetDestinationPort(senderPort);
 reply.Send(senderAddr);
}
```

#### See also

[GetDestinationAddress\(\)](#), [GetSourcePort\(\)](#), [GetSourceAddress6\(\)](#)

### 16.184.3.14 GetSourcePort()

```
uint16_t UDPPacket::GetSourcePort (
 void) const
```

Get source port from received packet or previously set value.

Returns the source port from the packet's UDP header. The meaning depends on whether this is a received packet or one you're preparing to send.

#### Returns

Port number (0-65535)

- For received packets: sender's port (where they sent FROM)
- For outgoing packets: your local port (set via SetSourcePort or auto-assigned)

**Note**

This is a const function and does not modify the packet

For received packets, this is the REMOTE sender's port - use this to reply

For outgoing packets, returns the port you set or 0 if auto-assigned

Essential for implementing request/response patterns

**Understanding Port Roles in Received Packets:**

When you receive a UDP packet:

- `GetSourcePort()` = Remote sender's port (use this to reply back to them)
- `GetDestinationPort()` = Your local listening port

**Common Use Cases:**

- **Reply Routing:** Getting sender's port to send response back
- **Connection Tracking:** Identifying which client sent a request
- **Port Filtering:** Accepting packets only from specific source ports
- **Logging:** Recording which port clients are using
- **Security:** Validating source port is in expected range

**Expand for Example Usage****Examples****Example Usage - Server Replying to Client:**

```
// Server receives request and replies to client
UDPPacket request;
if (request.Receive()) {
 IPADDR clientAddr = request.GetSourceAddress();
 uint16_t clientPort = request.GetSourcePort(); // Where to reply

 printf("Request from %s:%u\r\n",
 clientAddr.ToString(), clientPort);

 // Send response back to client
 UDPPacket response;
 response.SetDestinationPort(clientPort); // Use client's port
 response.AddData("ACK", 3);
 response.Send(clientAddr);
}
```

**Example Usage - Port-Based Request Routing:**

```
// Different handlers based on which port client used
UDPPacket pkt;
if (pkt.Receive()) {
 uint16_t clientPort = pkt.GetSourcePort();

 // Some protocols use specific source port ranges
 if (clientPort >= 49152 && clientPort <= 65535) {
 // Ephemeral port - typical client
 ProcessNormalRequest(pkt);
 } else if (clientPort == 5000) {
 // Specific port - might be peer-to-peer
 ProcessPeerRequest(pkt);
 } else {
 printf("Unusual source port: %u\r\n", clientPort);
 }
}
```

**Example Usage - Session Tracking:**

```
// Track multiple clients by IP:Port combination
struct ClientSession {
 IPADDR addr;
 uint16_t port;
 uint32_t lastSeen;
};

ClientSession sessions[MAX_CLIENTS];

UDPPacket pkt;
```

```

if (pkt.Receive()) {
 IPADDR clientAddr = pkt.GetSourceAddress();
 uint16_t clientPort = pkt.GetSourcePort();

 // Find or create session for this client
 for (int i = 0; i < MAX_CLIENTS; i++) {
 if (sessions[i].addr == clientAddr &&
 sessions[i].port == clientPort) {
 sessions[i].lastSeen = Secs; // Update timestamp
 ProcessKnownClient(pkt, &sessions[i]);
 break;
 }
 }
}

```

#### Example Usage - Security Filtering:

```

// Only accept packets from high ports (non-privileged clients)
UDPPacket pkt;
if (pkt.Receive()) {
 uint16_t sourcePort = pkt.GetSourcePort();

 if (sourcePort < 1024) {
 printf("Rejecting packet from privileged port %u\r\n", sourcePort);
 return; // Ignore packets from system ports
 }

 ProcessPacket(pkt);
}

```

#### See also

#### 16.184.3.15 Receive()

```

bool UDPPacket::Receive (
 OS_FIFO * pFifo,
 uint32_t wait_ticks) [inline]

```

Reuse packet object for multiple receives (efficiency optimization)

Receives a UDP packet from the specified FIFO queue with a timeout. This function blocks until a packet arrives or the timeout expires. The same packet object can be reused across multiple receives for efficiency (avoids repeated allocation).

#### Parameters

|                   |                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pFifo</i>      | Pointer to OS_FIFO queue to receive from (created by <a href="#">RegisterUDPFifo()</a> )                                                                                                                                                               |
| <i>wait_ticks</i> | Maximum time to wait for packet, in system ticks <ul style="list-style-type: none"> <li>• 0 = Non-blocking (return immediately if no packet)</li> <li>• TICKS_PER_SECOND = 1 second timeout</li> <li>• 0xFFFFFFFF = Wait forever (blocking)</li> </ul> |

#### Returns

true if packet received successfully  
false if timeout occurred or error

#### Note

**ALWAYS** call [Validate\(\)](#) after successful receive to check packet integrity

The packet object is reused - no need to create new [UDPPacket](#) each time

Previous packet data is overwritten on each successful receive

This is the preferred receive method for production code (efficient)

### Warning

Never process packet data without calling `Validate()` first

The pFifo must be created with `RegisterUDPFifo()` before use

`wait_ticks=0` returns immediately - check return value before accessing data

### Efficiency Benefits:

Reusing the same `UDPPacket` object across multiple receives:

- **Reduces memory allocation overhead** - no malloc/free per packet
- **Improves cache performance** - same memory addresses
- **Eliminates fragmentation** - stable memory footprint
- **Faster execution** - critical for high packet rates

### FIFO Setup:

Before calling `Receive()`, you must create a FIFO for the port:

```
OS_FIFO udpFifo;
OSFifoInit(&udpFifo);
RegisterUDPFifo(5000, &udpFifo); // Listen on port 5000
```

### Expand for Example Usage

#### Examples

##### Example Usage - Basic Server Loop:

```
// Setup
OS_FIFO udpFifo;
OSFifoInit(&udpFifo);
RegisterUDPFifo(5000, &udpFifo);

// Efficient receive loop - reuses same packet object
UDPPacket pkt;
while (running) {
 if (pkt.Receive(&udpFifo, TICKS_PER_SECOND * 2)) {
 if (pkt.Validate()) {
 ProcessPacket(pkt);
 } else {
 printf("Corrupted packet discarded\r\n");
 }
 } else {
 // Timeout - no packet received in 2 seconds
 HandleTimeout();
 }
}
```

##### Example Usage - Non-Blocking Receive:

```
UDPPacket pkt;

// Check for packet without blocking
if (pkt.Receive(&udpFifo, 0)) { // wait_ticks = 0
 if (pkt.Validate()) {
 printf("Packet received!\r\n");
 ProcessPacket(pkt);
 }
} else {
 // No packet available right now - continue other work
 DoOtherWork();
}
```

##### Example Usage - Multiple Ports:

```
// Listen on multiple ports with different FIFOs
OS_FIFO controlFifo, dataFifo;
OSFifoInit(&controlFifo);
OSFifoInit(&dataFifo);
RegisterUDPFifo(5000, &controlFifo); // Control port
RegisterUDPFifo(5001, &dataFifo); // Data port

UDPPacket pkt; // Reused for both ports
while (running) {
 // Check control port (non-blocking)
 if (pkt.Receive(&controlFifo, 0)) {
 if (pkt.Validate()) {
 ProcessControl(pkt);
 }
 }
}
```

```

 }
}

// Check data port (100ms timeout)
if (pkt.Receive(&dataFifo, TICKS_PER_SECOND / 10)) {
 if (pkt.Validate()) {
 ProcessData(pkt);
 }
}
}

```

#### Example Usage - Heartbeat with Timeout:

```

UDP_PACKET pkt;
uint32_t lastPacketTime = Secs;
const uint32_t HEARTBEAT_TIMEOUT = 10; // seconds

while (running) {
 // Wait up to 1 second for packet
 if (pkt.Receive(&udpFifo, TICKS_PER_SECOND)) {
 if (pkt.Validate()) {
 lastPacketTime = Secs;
 ProcessPacket(pkt);
 }
 }

 // Check for heartbeat timeout
 if ((Secs - lastPacketTime) > HEARTBEAT_TIMEOUT) {
 printf("Connection lost - no packets for %lu seconds\r\n",
 Secs - lastPacketTime);
 HandleConnectionLost();
 lastPacketTime = Secs; // Reset timer
 }
}

```

| wait_ticks Value      | Behavior     | Use Case                  |
|-----------------------|--------------|---------------------------|
| 0                     | Non-blocking | Polling, multi-tasking    |
| TICKS_PER_SECOND / 10 | 100ms        | Responsive UI updates     |
| TICKS_PER_SECOND      | 1 second     | Typical network timeout   |
| TICKS_PER_SECOND * 5  | 5 seconds    | Slow networks, retries    |
| 0xFFFFFFFF            | Forever      | Dedicated receive threads |

#### Timeout Values:

#### Performance Comparison:

```

// INEFFICIENT - Creates new packet each iteration
while (running) {
 UDP_PACKET pkt; // BAD: Allocates memory every loop
 if (pkt.Receive(&fifo, timeout)) {
 // process
 }
}

// EFFICIENT - Reuses same packet object
UDP_PACKET pkt; // GOOD: Allocated once
while (running) {
 if (pkt.Receive(&fifo, timeout)) {
 // process (much faster!)
 }
}

```

#### See also

[Validate\(\)](#), [RegisterUDPFifo\(\)](#), [OSFifoInit\(\)](#), [Send\(\)](#)

#### 16.184.3.16 ResetData()

```

void UDP_PACKET::ResetData (
 void)

```

Reset data size to 0 (clears packet)

This function resets the packet's data length to zero, effectively clearing the packet contents without deallocating memory. The packet buffer remains allocated and can be reused for new data.

**Note**

This does not free memory or destroy the packet object  
The packet buffer remains valid and can be immediately reused  
Does not reset packet metadata (addresses, ports, flags, etc.)

**Warning**

After calling this function, the packet contains no valid data. Any previous data references become invalid.

**Typical Use Cases:**

- Reusing a packet buffer for multiple transmissions
- Clearing received data before processing new packets
- Resetting packet state in error conditions

**Example Usage:**

```
UDPPacket packet;
packet.AddData("Hello", 5);
packet.Send(destIP, destPort);

// Reuse the same packet
packet.ResetData();
packet.AddData("World", 5);
packet.Send(destIP, destPort);
```

**See also**

[Validate\(\)](#)

**16.184.3.17 Send()**

```
void UDPPacket::Send (
 const IPADDR & to,
 uint8_t ttl = 0) [inline]
```

Send and free buffer (recommended - most efficient)

Sends the packet to the specified destination and immediately frees the buffer. This is the standard, most efficient way to send UDP packets. After calling this function, the packet buffer is freed and the [UDPPacket](#) object should not be used for sending again (though it can receive new data).

**Parameters**

|            |                                                                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>to</i>  | Destination IP address (IPv4 or IPv6)                                                                                                                                                                                                                            |
| <i>ttl</i> | Time-to-live value for packet (0 = use default TTL, typically 64) <ul style="list-style-type: none"><li>• 0: Use system default TTL</li><li>• 1: Local subnet only</li><li>• 32-64: Typical for Internet routing</li><li>• 255: Maximum (unrestricted)</li></ul> |

**Note**

This function wraps `Send6()` for unified IPv4/IPv6 handling  
Buffer is FREED immediately after send - most memory efficient  
This is the recommended send method for single-destination packets  
After [Send\(\)](#), destructor has nothing to clean up  
Cannot send to additional destinations after this call

**Warning**

- Do NOT access packet buffer after calling `Send()`
- Do NOT call `Send()` multiple times on the same packet
- Use `SendAndKeep()` instead if sending to multiple destinations

**Use Cases:**

- Standard single-destination UDP send (most common)
- Client sending request to server
- Server sending response to client
- Any scenario with one recipient
- When memory efficiency is important

**Typical Pattern:**

The most common UDP send pattern:

```
UDPPacket pkt;
pkt.SetSourcePort(5000);
pkt.SetDestinationPort(8080);
pkt.AddData("REQUEST", 7);
pkt.Send(serverIP); // Send and free - done!
```

**Memory Efficiency:**

```
Send() immediately:
Allocate -> Fill -> Send -> Free (minimal memory footprint)

vs SendAndKeep():
Allocate -> Fill -> Copy+Send -> Copy+Send -> Free (higher footprint)
```

**Expand for Example Usage****Examples****Example - Simple Request/Response:**

```
// Send request
UDPPacket request;
request.SetDestinationPort(5000);
request.AddData("GET_STATUS", 10);
request.Send(serverIP); // Buffer freed here

// Receive response
OS_FIFO responseFifo;
OSFifoInit(&responseFifo);
RegisterUDPFifo(0, &responseFifo);

UDPPacket response;
if (response.Receive(&responseFifo, TICKS_PER_SECOND * 5)) {
 if (response.Validate()) {
 ProcessResponse(response);
 }
}
```

**Example - Sensor Data Transmission:**

```
void SendSensorReading(float temperature, float humidity) {
 struct SensorData {
 uint32_t timestamp;
 float temp;
 float humid;
 } data = {Secs, temperature, humidity};

 UDPPacket pkt;
 pkt.SetDestinationPort(6000);
 pkt.AddData((uint8_t*)&data, sizeof(data));
 pkt.Send(dataCollectorIP); // Efficient single send
}
```

**Example - Efficient Batch Sending:**

```
// Reuse packet for multiple separate sends
UDPPacket pkt;
pkt.SetDestinationPort(7000);

for (int i = 0; i < 100; i++) {
 pkt.ResetData();
 pkt.AddDataWord(i);
 pkt.AddData("Data packet", 11);
 pkt.Send(serverIP); // Each send frees buffer

 OSTimeDly(TICKS_PER_SECOND / 10); // 100ms between packets
}
```

| Method                        | Memory | Speed  | Use When              |
|-------------------------------|--------|--------|-----------------------|
| <a href="#">Send()</a>        | Low    | Fast   | Single destination    |
| <a href="#">SendAndKeep()</a> | High   | Slower | Multiple destinations |

**Performance Comparison:****TTL Common Values:**

```
// Local subnet only (TTL=1)
pkt.Send(localIP, 1);

// Standard Internet (TTL=0, uses default ~64)
pkt.Send(remoteIP, 0);

// Extended reach (TTL=128)
pkt.Send(distantIP, 128);
```

**Lifecycle Comparison:**

```
// Method 1: Send() - Simple and efficient
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 pkt.Send(dest); // Buffer freed here
} // Destructor has nothing to do

// Method 2: No Send() - Destructor cleans up
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 // Forgot to send?
} // Destructor frees buffer (but packet never sent!)

// Method 3: SendAndKeep() - More complex
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 pkt.SendAndKeep(dest1); // Buffer still allocated
 pkt.Send(dest2); // Buffer freed here
} // Destructor has nothing to do
```

**Common Mistakes:**

```
// WRONG: Trying to send after Send()
UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.Send(dest1); // Buffer freed
pkt.Send(dest2); // CRASH: Buffer already freed!

// CORRECT: Use SendAndKeep() for multiple
UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.SendAndKeep(dest1); // Buffer retained
pkt.Send(dest2); // Buffer freed

// WRONG: Accessing buffer after Send()
UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.Send(dest);
pkt.AddData("More", 4); // CRASH: Buffer gone!

// CORRECT: Reset and reuse packet
```

```

UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.Send(dest);
// Wait for new data or receive
pkt.Receive(&fifo, timeout); // Gets new buffer

```

#### Best Practices:

- **Default choice:** Use [Send\(\)](#) for single-destination packets
- **Memory efficient:** Frees buffer immediately
- **Simple pattern:** Allocate -> Fill -> Send -> Done
- **Reusable packet:** Can receive new data after [Send\(\)](#)
- **Clear ownership:** Buffer freed, no ambiguity

#### See also

[SendAndKeep\(\)](#), [SendViaInterfaceNum\(\)](#), [AddData\(\)](#), [SetDestinationPort\(\)](#)

### 16.184.3.18 SendAndKeep()

```

void UDPPacket::SendAndKeep (
 const IPADDR & to,
 uint8_t ttl = 0) [inline]

```

Send copy, keep original (for sending to multiple destinations)

Sends a copy of the packet to the specified destination while retaining the original buffer for additional sends. This is essential when sending the same packet to multiple destinations. The buffer remains allocated until either [Send\(\)](#) is called or the packet is destroyed.

#### Parameters

|            |                                                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>to</i>  | Destination IP address (IPv4 or IPv6)                                                                                                                                                                                                                                 |
| <i>ttl</i> | Time-to-live value for packet (0 = use default TTL, typically 64) <ul style="list-style-type: none"> <li>• 0: Use system default TTL</li> <li>• 1: Local subnet only</li> <li>• 32-64: Typical for Internet routing</li> <li>• 255: Maximum (unrestricted)</li> </ul> |

#### Note

This function wraps [SendAndKeep6\(\)](#) for unified IPv4/IPv6 handling

Buffer is RETAINED after send - you must eventually call [Send\(\)](#) or let destructor run

Each call creates a new copy of the packet data

Less efficient than [Send\(\)](#) due to buffer copying

Use when you need to send the same data to multiple recipients

#### Warning

Must eventually free buffer with [Send\(\)](#) or allow destructor to run

Memory leak if you only use [SendAndKeep\(\)](#) and never [Send\(\)](#)

Each [SendAndKeep\(\)](#) allocates a new buffer - don't use in tight loops

**Use Cases:**

- Sending same data to multiple servers (redundancy)
- Broadcasting to multiple monitoring stations
- Fan-out messaging patterns
- Multicast alternative for small recipient lists
- Logging to multiple destinations

**Typical Pattern:**

Always end with `Send()` to free the buffer:

```
UDPPacket pkt;
pkt.SetDestinationPort(8080);
pkt.AddData("Alert: System temperature high", 30);

pkt.SendAndKeep(server1); // Copy sent, buffer kept
pkt.SendAndKeep(server2); // Copy sent, buffer kept
pkt.Send(server3); // Copy sent, buffer freed
// Buffer automatically freed by last Send()
```

**Memory Management:**

```
SendAndKeep(dest1) -> Creates copy -> Sends -> Keeps original
SendAndKeep(dest2) -> Creates copy -> Sends -> Keeps original
Send(dest3) -> Sends original -> Frees buffer

OR if no final Send():
SendAndKeep(dest1) -> Creates copy -> Sends -> Keeps original
SendAndKeep(dest2) -> Creates copy -> Sends -> Keeps original
~UDPPacket() -> Destructor frees original buffer
```

**Example - Multiple Monitoring Servers:**

```
void SendStatusToMonitors(const char* status) {
 IPADDR monitors[] = {
 AsciiToIp("192.168.1.10"),
 AsciiToIp("192.168.1.11"),
 AsciiToIp("192.168.1.12")
 };

 UDPPacket pkt;
 pkt.SetDestinationPort(9000);
 pkt.AddData(status);

 // Send to all but last
 for (int i = 0; i < 2; i++) {
 pkt.SendAndKeep(monitors[i]);
 }

 // Last send frees buffer
 pkt.Send(monitors[2]);
}
```

**Example - Redundant Server Communication:**

```
// Send critical data to primary and backup servers
UDPPacket criticalData;
criticalData.SetDestinationPort(5000);
criticalData.AddData("CRITICAL:SHUTDOWN", 17);

criticalData.SendAndKeep(primaryServer); // Send to primary
criticalData.Send(backupServer); // Send to backup and free
```

| Aspect      | Cost       | Notes                                                |
|-------------|------------|------------------------------------------------------|
| Buffer copy | Medium     | Each <code>SendAndKeep()</code> allocates new buffer |
| Network I/O | High       | N separate transmissions                             |
| Memory      | Higher     | Temporary buffers until final <code>Send()</code>    |
| Use when    | N is small | Typically < 10 destinations                          |

**Performance Considerations:**

**SendAndKeep() vs Send():**

```
// SendAndKeep() - Use for multiple destinations
pkt.SendAndKeep(dest1); // Buffer retained
pkt.Send(dest2); // Buffer freed

// Send() - Use for single destination (more efficient)
pkt.Send(dest); // Buffer freed immediately
```

| TTL | Scope                       | Use Case                     |
|-----|-----------------------------|------------------------------|
| 0   | System default (usually 64) | Normal operation             |
| 1   | Local subnet only           | Link-local communication     |
| 16  | Limited regional            | Campus networks              |
| 64  | Internet standard           | General Internet traffic     |
| 128 | Extended reach              | Cross-continent              |
| 255 | Maximum                     | Unrestricted (rarely needed) |

**TTL Values Guide:****Common Mistakes:**

```
// WRONG: Only SendAndKeep(), never freed
UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.SendAndKeep(dest1);
pkt.SendAndKeep(dest2);
// Memory leak! Buffer never freed

// CORRECT: End with Send()
UDPPacket pkt;
pkt.AddData("Hello", 5);
pkt.SendAndKeep(dest1);
pkt.Send(dest2); // Frees buffer

// ALSO CORRECT: Let destructor handle it
{
 UDPPacket pkt;
 pkt.AddData("Hello", 5);
 pkt.SendAndKeep(dest1);
 pkt.SendAndKeep(dest2);
} // Destructor frees buffer
```

**See also**

[Send\(\)](#), [SendViaInterfaceNum\(\)](#), [SendAndKeepViaInterfaceNum\(\)](#), [~UDPPacket\(\)](#)

**16.184.3.19 SendAndKeepViaIfAddr()**

```
void UDPPacket::SendAndKeepViaIfAddr (
 const IPADDR & to,
 const IPADDR & from_ip,
 uint8_t ttl = 0) [inline]
```

Send a packet and retain a copy via a specific interface address.

This inline function wraps [SendAndKeepViaIfAddr6\(\)](#) to send a packet to a destination IP address while routing through a specific source interface address. The function retains a copy of the packet after sending (useful for retransmission or logging).

**Parameters**

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <i>to</i>      | Destination IP address for the packet                     |
| <i>from_ip</i> | Source interface IP address to use for routing the packet |
| <i>ttl</i>     | Time-to-live value for the packet (0 = use default TTL)   |

**Note**

This is a convenience wrapper that delegates to `SendAndKeepVialfAddr6()`

The "keep" behavior suggests the packet buffer is preserved for potential reuse

**See also**

`SendAndKeepVialfAddr6()`

**16.184.3.20 SendAndKeepViaInterfaceNum()**

```
void UDPPacket::SendAndKeepViaInterfaceNum (
 const IPADDR & to,
 int interface,
 uint8_t ttl = 0) [inline]
```

Send copy via specific interface, keep original.

Sends a copy of the packet via a specific network interface while retaining the original buffer. This is essential for multi-homed systems where you need to send the same packet through multiple network interfaces or send to multiple destinations via specific interfaces.

**Parameters**

|                  |                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>to</i>        | Destination IP address (IPv4 or IPv6)                                                                                                                                                                                                                  |
| <i>interface</i> | Network interface number (0=first interface, 1=second, etc.) <ul style="list-style-type: none"><li>• 0: Primary interface (usually Ethernet 0)</li><li>• 1: Secondary interface (Ethernet 1, WiFi, etc.)</li><li>• 2+: Additional interfaces</li></ul> |
| <i>ttl</i>       | Time-to-live value for packet (0 = use default TTL) <ul style="list-style-type: none"><li>• 0: Use system default TTL</li><li>• 1: Local subnet only</li><li>• 32-64: Typical for Internet routing</li><li>• 255: Maximum (unrestricted)</li></ul>     |

**Note**

This function wraps `SendAndKeepViaInterfaceNum6()` for IPv4/IPv6 support

Buffer is RETAINED after send - must eventually call [Send\(\)](#) or rely on destructor

Each call creates a new copy of the packet data

Use when you need to send same data through multiple interfaces

Interface number must be valid (0 to `GetNumberOfInterfaces()-1`)

**Warning**

Must eventually free buffer with [Send\(\)](#) or allow destructor to run

Invalid interface numbers may cause send to fail silently

Buffer remains allocated - potential memory pressure if many calls

**Use Cases:**

- **Multi-homed systems:** Send via specific Ethernet port
- **Network redundancy:** Send same data via multiple interfaces
- **Interface testing:** Verify connectivity through specific interfaces
- **Network segregation:** Management vs data networks
- **Failover systems:** Primary and backup network paths

**Typical Pattern:**

Send via multiple interfaces, free with final [Send\(\)](#):

```
UDPPacket pkt;
pkt.SetDestinationPort(8080);
pkt.AddData("Status update", 13);

// Send via interface 0 (primary network)
pkt.SendAndKeepViaInterfaceNum(server, 0);

// Send via interface 1 (backup network)
pkt.SendViaInterfaceNum(server, 1); // Last send frees buffer
```

**Expand for Example Usage****Examples****Example - Redundant Networks:**

```
// System with dual Ethernet ports
void SendCriticalData(const char* data, IPADDR serverIP) {
 UDPPacket pkt;
 pkt.SetDestinationPort(9000);
 pkt.AddData(data);

 // Send via primary Ethernet
 pkt.SendAndKeepViaInterfaceNum(serverIP, 0);

 // Send via backup Ethernet
 pkt.SendViaInterfaceNum(serverIP, 1); // Frees buffer

 printf("Data sent via both interfaces\r\n");
}
```

**Example - Network Segregation:**

```
// Separate management and production networks
#define MGMT_INTERFACE 0
#define PROD_INTERFACE 1

void SendToMonitoring(const char* alert) {
 UDPPacket pkt;
 pkt.SetDestinationPort(514); // Syslog
 pkt.AddData(alert);

 // Send to management server via management interface
 pkt.SendAndKeepViaInterfaceNum(mgmtServer, MGMT_INTERFACE);

 // Send to production monitor via production interface
 pkt.SendViaInterfaceNum(prodMonitor, PROD_INTERFACE);
}
```

**Example - Interface Testing:**

```
// Test connectivity through each interface
void TestInterfaces(IPADDR testServer) {
 int numInterfaces = GetNumberOfInterfaces();

 UDPPacket pkt;
 pkt.SetDestinationPort(7000);
 pkt.AddData("PING", 4);

 for (int i = 0; i < numInterfaces - 1; i++) {
 printf("Testing interface %d\r\n", i);
 pkt.SendAndKeepViaInterfaceNum(testServer, i);
 }

 // Last interface - free buffer
 pkt.SendViaInterfaceNum(testServer, numInterfaces - 1);
}
```

| Scenario       | Interface Selection | Reason                       |
|----------------|---------------------|------------------------------|
| Primary data   | Interface 0         | Main network connection      |
| Management     | Interface 1         | Isolated management network  |
| Testing        | Iterate all         | Verify all paths working     |
| Redundancy     | Multiple            | Ensure delivery via any path |
| Load balancing | Round-robin         | Distribute traffic           |

#### Interface Selection Strategy:

#### Memory Management:

```
SendAndKeepViaIfNum(dest, 0) -> Copy -> Send via if0 -> Keep original
SendAndKeepViaIfNum(dest, 1) -> Copy -> Send via if1 -> Keep original
SendViaInterfaceNum(dest, 2) -> Send via if2 -> Free original
```

OR let destructor handle:

```
SendAndKeepViaIfNum(dest, 0) -> Copy -> Send via if0 -> Keep original
SendAndKeepViaIfNum(dest, 1) -> Copy -> Send via if1 -> Keep original
~UDPPacket() -> Destructor frees original
```

#### Checking Available Interfaces:

```
// Get number of interfaces
int numIfs = GetNumberOfInterfaces();
printf("System has %d network interfaces\r\n", numIfs);

// Get interface details
for (int i = 0; i < numIfs; i++) {
 InterfaceBlock* ifBlock = GetInterfaceBlock(i);
 if (ifBlock) {
 printf("Interface %d: %s\r\n", i,
 ifBlock->GetIPAddr().ToString());
 }
}
```

| Aspect             | Impact | Notes                              |
|--------------------|--------|------------------------------------|
| Buffer copy        | Medium | Each call allocates new buffer     |
| Network I/O        | High   | N separate transmissions           |
| Interface overhead | Low    | Just routing decision              |
| Memory             | Higher | Temporary buffers until final send |

#### Performance Considerations:

#### Common Mistakes:

```
// WRONG: Invalid interface number
pkt.SendAndKeepViaInterfaceNum(dest, 99); // Likely invalid!

// CORRECT: Check interface exists
int numIfs = GetNumberOfInterfaces();
if (interfaceNum < numIfs) {
 pkt.SendAndKeepViaInterfaceNum(dest, interfaceNum);
}

// WRONG: Never freed
pkt.SendAndKeepViaInterfaceNum(dest, 0);
pkt.SendAndKeepViaInterfaceNum(dest, 1);
// Memory leak!

// CORRECT: End with Send()
pkt.SendAndKeepViaInterfaceNum(dest, 0);
pkt.SendViaInterfaceNum(dest, 1); // Frees buffer
```

#### See also

[SendViaInterfaceNum\(\)](#), [SendAndKeep\(\)](#), [Send\(\)](#), [GetNumberOfInterfaces\(\)](#), [GetInterfaceBlock\(\)](#)

**16.184.3.21 SendViaIfAddr()**

```
void UDPPacket::SendViaIfAddr (
 const IPADDR & to,
 const IPADDR & from_ip,
 uint8_t ttl = 0) [inline]
```

Send a packet via a specific interface address.

This inline function sends a packet to a destination IP address while routing through a specific source interface address. Unlike [SendAndKeepViaIfAddr\(\)](#), this function does not retain a copy of the packet after transmission.

**Parameters**

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <i>to</i>      | Destination IP address for the packet                     |
| <i>from_ip</i> | Source interface IP address to use for routing the packet |
| <i>ttl</i>     | Time-to-live value for the packet (0 = use default TTL)   |

**Warning**

This function appears to be recursive - it calls itself. This is likely a bug and should probably call a different underlying implementation function.

**Note**

The recursive call will cause a stack overflow. Verify the intended implementation.

**16.184.3.22 SendViaInterfaceNum()**

```
void UDPPacket::SendViaInterfaceNum (
 const IPADDR & to,
 int interface,
 uint8_t ttl = 0) [inline]
```

Send via specific interface and free buffer.

Sends the packet via a specific network interface and immediately frees the buffer. This is the standard way to send a packet through a specific interface in multi-homed systems. The buffer is freed after sending, making this the most memory-efficient option for single-interface sends.

**Parameters**

|                  |                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>to</i>        | Destination IP address (IPv4 or IPv6)                                                                                                                                                                                                                                  |
| <i>interface</i> | Network interface number (0=first interface, 1=second, etc.) <ul style="list-style-type: none"> <li>• 0: Primary interface (usually Ethernet 0)</li> <li>• 1: Secondary interface (Ethernet 1, WiFi, etc.)</li> <li>• 2+: Additional interfaces</li> </ul>             |
| <i>ttl</i>       | Time-to-live value for packet (0 = use default TTL) <ul style="list-style-type: none"> <li>• 0: Use system default TTL (typically 64)</li> <li>• 1: Local subnet only</li> <li>• 32-64: Typical for Internet routing</li> <li>• 255: Maximum (unrestricted)</li> </ul> |

**Note**

This function wraps `SendViaInterfaceNum6()` for IPv4/IPv6 support  
 Buffer is FREED immediately after send  
 This is the recommended method for single-interface sends  
 Interface number must be valid (0 to `GetNumberOfInterfaces()-1`)  
 After this call, the buffer is freed and packet cannot send again

**Warning**

Do NOT access packet buffer after calling this function  
 Do NOT call send functions multiple times on the same packet  
 Invalid interface numbers may cause send to fail silently  
 Use [SendAndKeepViaInterfaceNum\(\)](#) if sending via multiple interfaces

**Use Cases:**

- **Interface-specific routing:** Force packet through specific interface
- **Multi-homed systems:** Separate management from production traffic
- **Network segregation:** Different interfaces for different purposes
- **Testing:** Verify specific interface functionality
- **Policy routing:** Business rules require specific interface

**Typical Pattern:**

Standard single-interface send:

```
UDPPacket pkt;
pkt.SetDestinationPort(8080);
pkt.AddData("Status", 6);

// Send via secondary interface (e.g., management network)
pkt.SendViaInterfaceNum(serverIP, 1); // Send and free
```

---

**Expand for Example Usage****Examples****Example - Management Network:**

```
// Send management traffic via dedicated interface
#define MGMT_INTERFACE 1

void SendManagementAlert(const char* alert, IPADDR mgmtServer) {
 UDPPacket pkt;
 pkt.SetDestinationPort(514); // Syslog
 pkt.AddData(alert);

 // Send via management interface only
 pkt.SendViaInterfaceNum(mgmtServer, MGMT_INTERFACE);

 printf("Alert sent via management interface\r\n");
}
```

**Example - Production Data Routing:**

```
// Route production data via high-speed interface
#define PROD_INTERFACE 0

void SendProductionData(const uint8_t* data, uint16_t len, IPADDR dest) {
 UDPPacket pkt;
 pkt.SetDestinationPort(6000);
 pkt.AddData(data, len);

 // Force through production interface
 pkt.SendViaInterfaceNum(dest, PROD_INTERFACE);
}
```

**Example - Interface Selection Based on Destination:**

```
void SendToDestination(const char* data, IPADDR dest) {
 UDPPacket pkt;
 pkt.SetDestinationPort(7000);
 pkt.AddData(data);

 // Choose interface based on destination
 int interface;
 if (IsManagementNetwork(dest)) {
 interface = 1; // Management interface
 } else {
 interface = 0; // Production interface
 }

 pkt.SendViaInterfaceNum(dest, interface);
}
```

**Example - Round-Robin Load Balancing:**

```
// Distribute traffic across multiple interfaces
static int nextInterface = 0;

void SendLoadBalanced(const char* data, IPADDR dest) {
 int numInterfaces = GetNumberOfInterfaces();

 UDPPacket pkt;
 pkt.SetDestinationPort(8000);
 pkt.AddData(data);

 // Send via next interface in rotation
 pkt.SendViaInterfaceNum(dest, nextInterface);

 // Move to next interface
 nextInterface = (nextInterface + 1) % numInterfaces;
}
```

| System Type       | Interface 0 | Interface 1 | Use Case               |
|-------------------|-------------|-------------|------------------------|
| Dual Ethernet     | Production  | Management  | Network segregation    |
| Ethernet + WiFi   | Wired       | Wireless    | Redundant connectivity |
| Multi-port router | LAN         | WAN         | Traffic direction      |
| Industrial system | Control     | Data        | Real-time vs bulk      |

**Interface Configuration Examples:****Verifying Interface Availability:**

```
bool SendViaInterfaceSafe(UDPPacket& pkt, IPADDR dest, int ifNum) {
 // Check if interface exists and is up
 if (ifNum < 0 || ifNum >= GetNumberOfInterfaces()) {
 printf("Invalid interface: %d\r\n", ifNum);
 return false;
 }

 InterfaceBlock* ifBlock = GetInterfaceBlock(ifNum);
 if (!ifBlock || !ifBlock->IsUp()) {
 printf("Interface %d is down\r\n", ifNum);
 return false;
 }

 // Interface valid and up
 pkt.SendViaInterfaceNum(dest, ifNum);
 return true;
}
```

| Method                                 | Memory | Speed   | Complexity | Use When                   |
|----------------------------------------|--------|---------|------------|----------------------------|
| <a href="#">SendViaInterfaceNum()</a>  | Low    | Fast    | Low        | Single interface           |
| <a href="#">SendAndKeepViaIfNum()</a>  | High   | Slower  | Medium     | Multiple interfaces        |
| <a href="#">Send()</a> (any interface) | Low    | Fastest | Lowest     | Don't care which interface |

**Performance Comparison:**

**TTL and Routing:**

```
// Local network via specific interface
pkt.SendViaInterfaceNum(localDest, 0, 1); // TTL=1, local only

// Internet destination via WAN interface
pkt.SendViaInterfaceNum(remoteDest, 1, 0); // TTL=default

// Extended reach via backup interface
pkt.SendViaInterfaceNum(farDest, 2, 128); // TTL=128, far reach
```

**Common Mistakes:**

```
// WRONG: Invalid interface number
pkt.SendViaInterfaceNum(dest, 99); // Probably invalid!

// CORRECT: Validate interface first
if (interface < GetNumberOfInterfaces()) {
 pkt.SendViaInterfaceNum(dest, interface);
}

// WRONG: Trying to send again after Send()
pkt.SendViaInterfaceNum(dest, 0); // Buffer freed
pkt.SendViaInterfaceNum(dest, 1); // CRASH: Buffer gone!

// CORRECT: Use SendAndKeep() for multiple
pkt.SendAndKeepViaInterfaceNum(dest, 0); // Buffer kept
pkt.SendViaInterfaceNum(dest, 1); // Buffer freed

// WRONG: Assuming interface exists
pkt.SendViaInterfaceNum(dest, 1); // What if only 1 interface?

// CORRECT: Check interface count
int numIf = GetNumberOfInterfaces();
if (numIf > 1) {
 pkt.SendViaInterfaceNum(dest, 1);
} else {
 pkt.Send(dest); // Use default interface
}
```

**Best Practices:**

- **Validate interface numbers** before use
- **Check interface status** (up/down) before sending
- **Use for policy routing** when specific path required
- **Default choice for multi-homed** systems with routing requirements
- **Document interface assignments** in code comments

**See also**

[SendAndKeepViaInterfaceNum\(\)](#), [Send\(\)](#), [SendViaIfAddr\(\)](#), [GetNumberOfInterfaces\(\)](#), [GetInterfaceBlock\(\)](#)

**16.184.3.23 SetDataSize()**

```
void UDPPacket::SetDataSize (
 uint16_t numBytes)
```

Set data size (REQUIRED after [GetDataBuffer\(\)](#) writes)

Maximum ~1472 bytes for standard Ethernet. Larger needs fragmentation.

```
// WRONG:
sprintf(pkt.GetDataBuffer(), "Hello");
pkt.Send(ip); // BUG: Size not set!

// CORRECT:
uint16_t len = sprintf(pkt.GetDataBuffer(), "Hello");
pkt.SetDataSize(len);
pkt.Send(ip);
```

**16.184.3.24 SetDestinationPort()**

```
void UDPPacket::SetDestinationPort (
 uint16_t port)
```

Set destination port (standard services: 53=DNS, 80=HTTP, 123=NTP, 161=SNMP)

Sets the destination UDP port for outgoing packets. The port identifies which service or application on the remote host should receive the packet.

## Parameters

|             |                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>port</i> | Destination port number (1-65535) <ul style="list-style-type: none"> <li>• 0 is reserved and should not be used</li> <li>• 1-1023 are well-known ports (require privileges on most systems)</li> <li>• 1024-49151 are registered ports</li> <li>• 49152-65535 are dynamic/private ports</li> </ul> |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Note

This only affects outgoing packets sent via [Send\(\)](#)

For received packets, use [GetSourcePort\(\)](#) to see sender's port

| Port  | Service              | Description                |
|-------|----------------------|----------------------------|
| 53    | DNS                  | Domain Name System         |
| 67/68 | <a href="#">DHCP</a> | Dynamic Host Configuration |
| 80    | HTTP                 | Web Server                 |
| 123   | NTP                  | Network Time Protocol      |
| 161   | SNMP                 | Simple Network Management  |
| 443   | HTTPS                | Secure Web Server          |
| 1883  | <a href="#">MQTT</a> | Message Queue Telemetry    |
| 5353  | mDNS                 | Multicast DNS              |

## Common Well-Known Ports:

## Example Usage:

```
UDPPacket pkt;
pkt.SetDestinationPort(8080); // Custom application port
pkt.AddData("Hello", 5);
pkt.Send(serverIP);
```

## See also

[GetDestinationPort\(\)](#), [GetSourcePort\(\)](#), [Send\(\)](#)

## 16.184.3.25 SetDSCP()

```
void UDPPacket::SetDSCP (
 uint8_t dscp)
```

Set DSCP for QoS (0=best effort, 46=VoIP/EF, 34=video/AF41, 8=bulk/CS1)

Standard DSCP values (RFC 4594):

- 0: Best Effort (default)
- 8: CS1 (bulk data, lower priority)
- 34: AF41 (high priority video)
- 46: EF (VoIP, low latency/jitter)
- 48: CS6 (network control)

```
pkt.SetDSCP(46); // Mark as VoIP for priority treatment
```

## Note

Requires network QoS support to have effect

**16.184.3.26 SetSourcePort()**

```
void UDPPacket::SetSourcePort (
 uint16_t port)
```

Set source port (0=auto-assign ephemeral port, 1024-65535=specific port)

Sets the source UDP port for outgoing packets. The source port identifies which local port the packet originates from and where replies should be sent.

**Parameters**

|             |                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>port</i> | Source port number: <ul style="list-style-type: none"> <li>• 0 = Auto-assign ephemeral port (recommended for clients)</li> <li>• 1-1023 = Well-known/system ports (avoid unless necessary)</li> <li>• 1024-49151 = Registered ports (safe for servers)</li> <li>• 49152-65535 = Dynamic/private ports (system auto-assignment range)</li> </ul> |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note**

For CLIENT applications, use 0 to let the stack auto-assign an ephemeral port

For SERVER applications, use a fixed port so clients know where to send

The stack automatically assigns ports from the ephemeral range when port=0

Setting port to 0 is equivalent to not calling this function

| Application Type | Recommended Port        | Reason                              |
|------------------|-------------------------|-------------------------------------|
| UDP Server       | Fixed port (e.g., 5000) | Clients need to know where to send  |
| UDP Client       | 0 (auto-assign)         | Don't care which local port is used |
| Peer-to-Peer     | Fixed port              | Both sides need predictable ports   |
| Reply Packet     | Use 0 or leave default  | Stack handles reply routing         |

**Port Selection Guidelines:****Server vs Client Pattern:**

**Servers** listen on FIXED ports:

- Servers: Use fixed port (e.g., 5000, 8080) so clients know where to connect
- Must be consistent across reboots
- Typically documented/configured value

**Clients** use AUTO-ASSIGNED ports:

- Clients: Use 0 for auto-assignment - you don't care which local port
- Different port for each connection/packet
- Server uses [GetSourcePort\(\)](#) from received packet to reply

**Expand for Example Usage****Examples**

**Example Usage - UDP Server:**

```
// Server application listening on port 5000
void ServerTask(void *pd) {
 UDPPacket pkt;
 pkt.SetSourcePort(5000); // Fixed port - clients send here

 while (1) {
 if (pkt.Receive()) {
 ProcessRequest(pkt);

 // Reply to client
 UDPPacket reply;
 reply.SetDestinationPort(pkt.GetSourcePort()); // Client's port
 reply.AddData("Response", 8);
 reply.Send(pkt.GetSourceAddress());
 }
 }
}
```

**Example Usage - UDP Client:**

```
// Client application sending to server
void SendRequest(IPADDR serverIP, uint16_t serverPort) {
 UDPPacket pkt;
 pkt.SetSourcePort(0); // Auto-assign - don't care which port
 // Or just omit SetSourcePort() entirely - same effect

 pkt.SetDestinationPort(serverPort); // Server's known port
 pkt.AddData("Request", 7);
 pkt.Send(serverIP);
}
```

**Example Usage - Peer-to-Peer:**

```
// Both sides use fixed ports for peer-to-peer communication
#define MY_PORT 6000
#define PEER_PORT 6000

UDPPacket pkt;
pkt.SetSourcePort(MY_PORT); // My fixed port
pkt.SetDestinationPort(PEER_PORT); // Peer's fixed port
pkt.AddData("Hello", 5);
pkt.Send(peerIP);
```

**Warning**

- Using port 0 for servers makes them unreachable - clients won't know the port
- Reusing well-known ports (1-1023) may conflict with system services
- Fixed ports must be available (not already in use by another application)

**See also**

[GetSourcePort\(\)](#), [SetDestinationPort\(\)](#), [Send\(\)](#)

**16.184.3.27 Validate()**

```
BOOL UDPPacket::Validate (
 void)
```

Validate received packet (checks checksum and data presence)

**ALWAYS call after receiving packet!**

This function performs integrity checks on a received packet to ensure:

- The packet checksum is correct (data not corrupted in transit)
- Required data fields are present and populated
- The packet structure is valid

**Returns**

- true if the packet is valid and safe to process
- false if the packet is corrupt, incomplete, or timed out

**Warning**

Failure to call this function before processing packet data may result in processing corrupted or malicious data

**Note**

This function should be called immediately after any packet receive operation

**Example Usage:**

```
if (packet.Validate()) {
 // Safe to process packet data
 ProcessPacketData(packet);
} else {
 // Discard corrupted packet
 printf("Invalid packet received\r\n");
}
```

The documentation for this class was generated from the following file:

- udp.h

## 16.185 UDPPKT Struct Reference

Internal UDP Packet Header Structure.

```
#include <ip.h>
```

**Public Attributes**

- `beuint16_t srcPort`  
*Source port number (0-65535)*
- `beuint16_t dstPort`  
*Destination port number (0-65535)*
- `beuint16_t UdpLen`  
*Datagram length in bytes including UDP header and data (minimum 8 bytes)*
- `uint16_t UdpCSum`  
*UDP checksum (optional in IPv4, mandatory in IPv6)*
- `uint8_t DATA []`  
*Flexible array member - UDP payload data follows header (actual length = UdpLen - 8)*

### 16.185.1 Detailed Description

Internal UDP Packet Header Structure.

Standard UDP header as defined in RFC 768. This structure represents the 8-byte UDP header that precedes the UDP payload data.

The DATA[] flexible array member allows direct access to the UDP payload that follows the header.

**Note**

This structure is packed to ensure proper alignment with network packet data.

UDP header is always 8 bytes long (no options like TCP).

The checksum is optional in IPv4 (can be zero) but mandatory in IPv6.

### 16.185.2 Member Data Documentation

#### 16.185.2.1 UdpCSum

```
uint16_t UDPPKT::UdpCSum
```

UDP checksum (optional in IPv4, mandatory in IPv6)

**Warning**

Do not make big endian - see [IPPKT::hCSum](#) for explanation

The documentation for this struct was generated from the following file:

- ip.h

## 16.186 UniqueIdentifier Class Reference

Get the 128-bit Unique Identifier.

```
#include <bsp.h>
```

### Public Member Functions

- `const uint8_t * GetUniqueIdentifier ()`  
*Will attempt to read the Unique Identifier from flash memory.*
- `UniqueIdentifier ()`  
*Create a [UniqueIdentifier](#) object and read the Unique Identifier from flash memory.*
- `const uint8_t * GetBuffer ()`  
*Get a pointer to the buffer containing the uniqueID.*
- `void Print ()`  
*Print the 128-bit UniqueID in hex to serial.*
- `const uint8_t * GetUniqueIdentifier ()`  
*Will attempt to read the Unique Identifier from flash memory.*
- `UniqueIdentifier ()`  
*Create a [UniqueIdentifier](#) object and read the Unique Identifier from flash memory.*
- `const uint8_t * GetBuffer ()`  
*Get a pointer to the buffer containing the uniqueID.*
- `void Print ()`  
*Print the 128-bit UniqueID in hex to serial.*

### 16.186.1 Detailed Description

Get the 128-bit Unique Identifier.

Each MODM7AE70 is programmed with a 128-bit unique identifier in flash memory. This class exposes functions to get the 128-bit unique ID in a 16-byte array of type `uint8_t`.

Each SBE70LC is programmed with a 128-bit unique identifier in flash memory. This class exposes functions to get the 128-bit unique ID in a 16-byte array of type `uint8_t`.

### 16.186.2 Member Function Documentation

#### 16.186.2.1 [GetBuffer\(\)](#) [1/2]

```
const uint8_t * UniqueIdentifier::GetBuffer () [inline]
```

Get a pointer to the buffer containing the uniqueID.

#### Returns

A pointer to the buffer containing the uniqueID.

#### 16.186.2.2 [GetBuffer\(\)](#) [2/2]

```
const uint8_t * UniqueIdentifier::GetBuffer () [inline]
```

Get a pointer to the buffer containing the uniqueID.

#### Returns

A pointer to the buffer containing the uniqueID.

**16.186.2.3 GetUniqueIdentifier() [1/2]**

```
const uint8_t * UniqueIdentifier::GetUniqueIdentifier ()
```

Will attempt to read the Unique Identifier from flash memory.

**Returns**

If successful, returns a pointer to the buffer containing the uniqueID. Otherwise, returns a nullptr.

**16.186.2.4 GetUniqueIdentifier() [2/2]**

```
const uint8_t * UniqueIdentifier::GetUniqueIdentifier ()
```

Will attempt to read the Unique Identifier from flash memory.

**Returns**

If successful, returns a pointer to the buffer containing the uniqueID. Otherwise, returns a nullptr.

The documentation for this class was generated from the following files:

- MODM7AE70/include/bsp.h
- SBE70LC/include/bsp.h

**16.187 UserAuthManager Class Reference**

The user authorization manager class allows application developers the ability to manage user authorization records. The can be loaded and saved to any storage space, including the config system or UserParams. Authorization values are hashed before being saved. Validation compares both the hash as well as the authorization type. Adding, updating, and removing records will automatically call the user devined save functions. For usage, please see the example found in `examples/SSH/sshServerUserAuth`.

```
#include <UserAuthManager.h>
```

**Public Member Functions**

- **UserAuthManager ()**  
*Default constructor.*
- **~UserAuthManager ()**  
*Default destructor.*
- **bool Init (SaveAuthRecordsFn svRcFn, LoadAuthRecordsFn ldRcFn)**  
*Initialization function. Must be called before use.*
- **bool UserExists (const NBString &userName)**  
*Determines if a user record exists.*
- **AuthResponse AddUserAuth (const NBString &userName, const NBString &auth, AuthType authType)**  
*Attempts to add a user authorization record. This will automatically call the save record function if the user is added.*
- **AuthResponse CheckUserAuth (const NBString &userName, const NBString &auth, AuthType authType)**  
*Checks the for a user and compares the authorization value to what is stored.*
- **AuthResponse CheckUserAuth (const NBString &userName, byte \*auth, AuthType authType)**  
*Checks the for a user and compares the authorization value to what is stored.*
- **AuthResponse UpdateUserAuth (const NBString &userName, const NBString &newAuth, AuthType authType)**  
*Updates a user authorization record with the information provided. This function will automatically save all user records if the changes are successful.*
- **AuthResponse RemoveUserAuth (const NBString &userName)**  
*Remove a user authorization record. This function will automatically save all user records if the removal is successful.*
- **AuthResponse CheckUserAuthLevel (const NBString &userName, uint32\_t authLevel, bool hasAll=true)**  
*Checks the user against the specific authLevel.*
- **AuthResponse SetUserAuthLevel (const NBString &userName, uint32\_t authLevel)**

*This adds the authorization levels passed in to the user's current authorization level.*

- **AuthResponse** **ClrUserAuthLevel** (const **NBString** &userName, uint32\_t authLevel)

*Clears the authorization for the specified user.*

- void **ListUsers** ()

*Lists the users currently in the User Authorization Record system, along with their saved authorization type and level.*

- int **GetMaxAuthRecords** ()

*Gets the maximum number of authorization records available to the system. This can be changed with the macro **MAX\_AUTH\_RECORDS**.*

### 16.187.1 Detailed Description

The user authorization manager class allows application developers the ability to manage user authorization records. The can be loaded and saved to any storage space, including the config system or UserParams. Authorization values are hashed before being saved. Validation compares both the hash as well as the authorization type. Adding, updating, and removing records will automatically call the user devined save functions. For usage, please see the example found in `examples/SSH/sshServerUserAuth`.

### 16.187.2 Member Function Documentation

#### 16.187.2.1 AddUserAuth()

```
AuthResponse UserAuthManager::AddUserAuth (
 const NBString & userName,
 const NBString & auth,
 AuthType authType)
```

Attempts to add a user authorization record. This will automatically call the save record function if the user is added.

##### Parameters

|                 |                                                    |
|-----------------|----------------------------------------------------|
| <i>userName</i> | The username to add.                               |
| <i>auth</i>     | The authorization value to hash and store.         |
| <i>authType</i> | The authorization type of the authorization value. |

##### Return values

|                      |                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the user was successfully added.                                                             |
| <i>!eAuthSuccess</i> | If the user was not added successfully. The AuthResponse error code returned will indicate why. |

#### 16.187.2.2 CheckUserAuth() [1/2]

```
AuthResponse UserAuthManager::CheckUserAuth (
 const NBString & userName,
 byte * auth,
 AuthType authType)
```

Checks the for a user and compares the authorization value to what is stored.

##### Parameters

|                 |                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| <i>userName</i> | The username to check against.                                                                                      |
| <i>auth</i>     | The authorization value to compare as hashed value. This will be compared directly to what is stored in the record. |
| <i>authType</i> | The authorization type of the authorization value.                                                                  |

## Return values

|                      |                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the user exists and the authorization value matches what was stored                                                    |
| <i>!eAuthSuccess</i> | If the user does not exist or the authorization comparison fails. The AuthResponse error code returned will indicate why. |

**16.187.2.3 CheckUserAuth() [2/2]**

```
AuthResponse UserAuthManager::CheckUserAuth (
 const NBString & userName,
 const NBString & auth,
 AuthType authType)
```

Checks the for a user and compares the authorization value to what is stored.

## Parameters

|                 |                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------|
| <i>userName</i> | The username to check against.                                                                           |
| <i>auth</i>     | The authorization value to compare as a plain string. This value will be hashed before getting compared. |
| <i>authType</i> | The authorization type of the authorization value.                                                       |

## Return values

|                      |                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the user exists and the authorization value matches what was stored                                                    |
| <i>!eAuthSuccess</i> | If the user does not exist or the authorization comparison fails. The AuthResponse error code returned will indicate why. |

**16.187.2.4 CheckUserAuthLevel()**

```
AuthResponse UserAuthManager::CheckUserAuthLevel (
 const NBString & userName,
 uint32_t authLevel,
 bool hasAll = true)
```

Checks the user against the specific authLevel.

## Parameters

|                  |                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>userName</i>  | The username to check.                                                                                                                                                                                                                     |
| <i>authLevel</i> | The authorization level to check against. This check compares the bits passed in against the bits set on the user's authLevel.                                                                                                             |
| <i>hasAll</i>    | Used to establish the conditions for the check to pass. If hasAll is true, then every bit passed in must be set on the user's authLevel for the check to pass. If hasAll is false, then only one bit needs to match for the check to pass. |

## Return values

|                      |                                                                      |
|----------------------|----------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the check passed and the user has the proper authorization level. |
| <i>!eAuthSuccess</i> | If the user does not have the proper authorization level.            |

### 16.187.2.5 ClrUserAuthLevel()

```
AuthResponse UserAuthManager::ClrUserAuthLevel (
 const NBString & userName,
 uint32_t authLevel)
```

Clears the authorization for the specified user.

#### Parameters

|                  |                                   |
|------------------|-----------------------------------|
| <i>userName</i>  | The username to check.            |
| <i>authLevel</i> | The authorization level to clear. |

#### Return values

|                      |                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the specified authorization level was successfully cleared and saved.                                           |
| <i>!eAuthSuccess</i> | If the authorization level could not be cleared and saved. The AuthResponse error code returned will indicate why. |

### 16.187.2.6 Init()

```
bool UserAuthManager::Init (
 SaveAuthRecordsFn svRcFn,
 LoadAuthRecordsFn ldRcFn)
```

Initialization function. Must be called before use.

#### Parameters

|               |                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>svRcFn</i> | The user defined function that will save authorization records.                                                         |
| <i>ldRcFn</i> | The user defined function that will load the authorization records from storage. Called inside <a href="#">init()</a> . |

#### Return values

|             |                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------|
| <i>true</i> | If successfully initialized, and the users are properly loaded.                                           |
| <i>!0</i>   | If there was an error initializing the object, or the users were not successfully loaded. Error code will |

### 16.187.2.7 RemoveUserAuth()

```
AuthResponse UserAuthManager::RemoveUserAuth (
 const NBString & userName)
```

Remove a user authorization record. This function will automatically save all user records if the removal is successful.

#### Parameters

|                 |                         |
|-----------------|-------------------------|
| <i>userName</i> | The username to remove. |
|-----------------|-------------------------|

#### Return values

|                      |                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the user record was successfully removed.                                                     |
| <i>!eAuthSuccess</i> | If the user record could not be removed. The AuthResponse error code returned will indicate why. |

### 16.187.2.8 SetUserAuthLevel()

```
AuthResponse UserAuthManager::SetUserAuthLevel (
 const NSString & userName,
 uint32_t authLevel)
```

This adds the authorization levels passed in to the user's current authorization level.

#### Parameters

|                  |                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>userName</i>  | The username to check.                                                                                                         |
| <i>authLevel</i> | The authorization level to check against. This check compares the bits passed in against the bits set on the user's authLevel. |

#### Return values

|                      |                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the the user authorization level was properly set and saved.                                                       |
| <i>!eAuthSuccess</i> | If the user's authorization level could not be set and saved. The AuthResponse error code returned will indicate why. |

### 16.187.2.9 UpdateUserAuth()

```
AuthResponse UserAuthManager::UpdateUserAuth (
 const NSString & userName,
 const NSString & newAuth,
 AuthType authType)
```

Updates a user authorization record with the information provided. This function will automatically save all user records if the changes are successful.

#### Parameters

|                 |                                                    |
|-----------------|----------------------------------------------------|
| <i>userName</i> | The username to check against.                     |
| <i>newAuth</i>  | The new authorization value to assign to the user. |
| <i>authType</i> | The authorization type of the authorization value. |

#### Return values

|                      |                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------|
| <i>eAuthSuccess</i>  | If the user record was successfully updated.                                                     |
| <i>!eAuthSuccess</i> | If the user record could not be updated. The AuthResponse error code returned will indicate why. |

### 16.187.2.10 UserExists()

```
bool UserAuthManager::UserExists (
 const NSString & userName)
```

Determines if a user record exists.

#### Parameters

|                 |                        |
|-----------------|------------------------|
| <i>userName</i> | The username to check. |
|-----------------|------------------------|

#### Return values

|              |                             |
|--------------|-----------------------------|
| <i>true</i>  | If the user exists.         |
| <i>false</i> | If the user does not exist. |

---

The documentation for this class was generated from the following file:

- `UserAuthManager.h`

## 16.188 UserAuthRecord Struct Reference

A stored record of a user's authorization credentials. The value is hashed when saved so it can't be read directly. User's can currently only have one authorization record per user name.

```
#include <UserAuthManager.h>
```

### Public Attributes

- [NSString](#) `m_userName`  
*The username for the record. This value must be unique across all records.*
- `uint8_t m_authHash [WC_SHA256_DIGEST_SIZE]`  
*The hashed representation of the authentication value.*
- [AuthType](#) `m_authType`  
*The type of authentication hashes. Currently supported are keys and passwords.*
- `uint32_t m_authLevel`

### 16.188.1 Detailed Description

A stored record of a user's authorization credentials. The value is hashed when saved so it can't be read directly. User's can currently only have one authorization record per user name.

### 16.188.2 Member Data Documentation

#### 16.188.2.1 `m_authLevel`

```
uint32_t UserAuthRecord::m_authLevel
```

The authorization level granted to this user. This is treated as a bit field, and authorization checks look for specific bits being set.

The documentation for this struct was generated from the following file:

- `UserAuthManager.h`

## 16.189 WebConfigServlet Class Reference

Class to run web configurator.

```
#include <config_server.h>
```

Inherits `servlet`.

### 16.189.1 Detailed Description

Class to run web configurator.

The documentation for this class was generated from the following file:

- `config_server.h`

## 16.190 NB::WebSocket Class Reference

[WebSocket](#) connection management class.

```
#include <websockets.h>
```

## Public Member Functions

- int [WriteData](#) (const char \*buf, int nbytes)  
*Write data to the [WebSocket](#) connection.*
- int [ReadData](#) (char \*buf, int nbytes)  
*Read data from the [WebSocket](#) connection.*
- void [Flush](#) ()  
*Flush buffered transmit data to the network.*
- void [Pong](#) (uint32\_t len)  
*Send a pong frame in response to a ping.*
- WS\_State [GetState](#) ()  
*Get the current connection state of the [WebSocket](#).*
- int [Ping](#) (uint32\_t len, uint32\_t \*sentTick)  
*Send a [WebSocket](#) ping frame and record the timestamp.*
- int [WaitForPingReply](#) (uint32\_t timeout)  
*Block waiting for a pong reply to a previously sent ping.*
- int [GetPingReplyTick](#) (uint32\_t \*replyTick)  
*Get the tick count when the last pong was received.*
- int [setoption](#) (int option)  
*Set a socket option on this [WebSocket](#) connection.*
- int [clroption](#) (int option)  
*Clear a socket option on this [WebSocket](#) connection.*
- int [getoption](#) ()  
*Get the current socket options bitmap.*
- int [GetWriteSpace](#) ()  
*Get available transmit buffer space in bytes.*
- void [DumpSock](#) ()  
*Dump detailed state information for this [WebSocket](#) connection.*

## Static Public Member Functions

- static int [ws\\_readwto](#) (int fd, char \*buf, int nbytes, int timeout)  
*Read data from a [WebSocket](#) connection with timeout.*
- static int [ws\\_read](#) (int fd, char \*buf, int nbytes)  
*Read data from a [WebSocket](#) connection.*
- static int [ws\\_write](#) (int fd, const char \*buf, int nbytes)  
*Write data to a [WebSocket](#) connection.*
- static int [ws\\_externalclose](#) (int fd)  
*Close a [WebSocket](#) connection from an external caller.*
- static void [ws\\_flush](#) (int fd)  
*Flush the transmit buffer of a [WebSocket](#) connection.*
- static int [ws\\_setoption](#) (int fd, int option)  
*Set a socket option on a [WebSocket](#) connection.*
- static int [ws\\_clroption](#) (int fd, int option)  
*Clear a socket option on a [WebSocket](#) connection.*
- static int [ws\\_getoption](#) (int fd)  
*Get the current socket options for a [WebSocket](#) connection.*
- static [WebSocket](#) \* [GetWebSocketRecord](#) (int fd)  
*Find a [WebSocket](#) record by its file descriptor.*
- static int [promote\\_tcp\\_ws](#) (int tcp\_fd)  
*Promote a TCP socket to a [WebSocket](#) connection after successful handshake.*
- static void [ws\\_read\\_notify](#) (int fd)

- TCP read notification callback invoked when data is available on the [WebSocket](#).*

  - static void [ws\\_write\\_notify](#) (int fd)

*TCP write notification callback invoked when buffer space becomes available.*
- static void [GetFlushTime](#) ()

*Updates the global flush timing for [WebSocket](#) message delivery.*
- static void [RunSkippedCallBack](#) ()

*Executes the callback function when a scheduled run is skipped.*
- static int [Connect](#) (const char \*host, const char \*resource, const char \*protocol, int portnum=80, bool useSSL=false)

*Connect to a [WebSocket](#) server using hostname with optional protocol negotiation.*
- static int [Connect](#) (const char \*host, const char \*resource, int portnum=80, bool useSSL=false)

*Connect to a [WebSocket](#) server using hostname without protocol negotiation.*
- static int [Connect](#) (IPADDR host, const char \*resource, const char \*protocol, int portnum=80, bool useSSL=false)

*Connect to a [WebSocket](#) server using IP address with optional protocol negotiation.*
- static int [Connect](#) (IPADDR host, const char \*resource, int portnum=80, bool useSSL=false)

*Connect to a [WebSocket](#) server using IP address without protocol negotiation.*
- static void [DumpSockets](#) ()

*Dump detailed state information for all active [WebSocket](#) connections.*
- static int [GetFreeWebSocketCount](#) ()

*Get the number of available [WebSocket](#) connection slots.*

## Public Attributes

- int [m\\_fd\\_tcp](#)
- TCP socket file descriptor (underlying transport)*
- int [m\\_fd\\_ws](#)
- [WebSocket](#) file descriptor (application-level identifier)*
- OS\_CRIT [socket\\_crit](#)
- Critical section for thread-safe socket operations.*

## Static Public Attributes

- static int [s\\_openSocketCount](#)
- Number of currently open [WebSocket](#) connections.*
- static [WebSocket](#) WSSockStructs [[WS\\_MAX\\_SOCKETS](#)]
- Static array of [WebSocket](#) connection structures.*

## 16.190.1 Detailed Description

[WebSocket](#) connection management class.

Handles [WebSocket](#) protocol implementation including frame parsing, connection state, and bidirectional communication over TCP. Supports both client and server roles.

```
{
```

## 16.190.2 Member Function Documentation

### 16.190.2.1 clroption()

```
int NB::WebSocket::clroption (
 int option)
```

Clear a socket option on this [WebSocket](#) connection.

## Parameters

|               |                                                                          |
|---------------|--------------------------------------------------------------------------|
| <i>option</i> | The socket option to clear (e.g., WS_SO_TEXT, TCP_NODELAY, SO_KEEPALIVE) |
|---------------|--------------------------------------------------------------------------|

## Returns

int Returns 0 on success, negative value on failure

This member function clears (disables) a specific socket option on the [WebSocket](#) connection. It is the counterpart to [setoption\(\)](#) and allows you to disable previously enabled options or ensure certain options are not active. Clearing an option returns the socket to its default behavior for that particular setting. This is useful when you need to:

- Dynamically adjust socket behavior based on runtime conditions
- Revert configuration changes
- Switch between mutually exclusive options (e.g., text vs binary mode)
- Restore default settings

Clearing an option that was never set has no effect and typically succeeds.

## Note

Some options may not be clearable once set, depending on the underlying socket implementation. Check the return value to verify success.

## See also

[setoption\(\)](#) for setting socket options

[getoption\(\)](#) for querying current option state

## Example Usage

---

Expand for Example Usage

## Examples

## Disable Binary Mode

```
WebSocket *ws = GetActiveWebSocket();

// Clear binary mode, revert to default (text mode)
if (ws->clroption(WS_SO_BINARY) == 0) {
 printf("Binary mode disabled, reverted to text mode\n");
} else {
 printf("Failed to clear binary mode\n");
}
```

## Disable TCP Keepalive

```
WebSocket *ws = GetActiveWebSocket();

// Disable keepalive (maybe to reduce network traffic)
if (ws->clroption(SO_KEEPALIVE) == 0) {
 printf("TCP keepalive disabled\n");
} else {
 printf("Failed to disable keepalive\n");
}
```

## Re-enable Nagle's Algorithm

```
void RestoreBufferingMode(WebSocket *ws) {
 // Clear TCP_NODELAY to re-enable Nagle's algorithm
 if (ws->clroption(TCP_NODELAY) == 0) {
 printf("Nagle's algorithm re-enabled (buffering mode)\n");
 } else {
 printf("WARNING: Could not re-enable buffering\n");
 }
}
```

### Toggle WebSocket Mode

```
void ToggleWebSocketMode(WebSocket *ws, bool enable_binary) {
 if (enable_binary) {
 ws->clroption(WS_SO_TEXT);
 ws->setoption(WS_SO_BINARY);
 printf("Switched to binary mode\n");
 } else {
 ws->clroption(WS_SO_BINARY);
 ws->setoption(WS_SO_TEXT);
 printf("Switched to text mode\n");
 }
}
```

### Reset to Default Configuration

```
void ResetWebSocketOptions(WebSocket *ws) {
 printf("Resetting WebSocket to default options...\n");

 // Clear all custom options
 ws->clroption(WS_SO_BINARY);
 ws->clroption(WS_SO_COMPRESS);
 ws->clroption(TCP_NODELAY);
 ws->clroption(SO_KEEPALIVE);

 // Set default text mode
 ws->setoption(WS_SO_TEXT);

 printf("WebSocket reset to defaults\n");
}
```

### Conditional Option Clearing

```
void AdjustWebSocketForPowerMode(WebSocket *ws, bool low_power_mode) {
 if (low_power_mode) {
 // Disable features that increase power consumption
 ws->clroption(SO_KEEPALIVE);
 ws->clroption(TCP_NODELAY);
 printf("Low power mode: disabled keepalive and nodelay\n");
 } else {
 // Re-enable performance features
 ws->setoption(SO_KEEPALIVE);
 ws->setoption(TCP_NODELAY);
 printf("Normal power mode: enabled keepalive and nodelay\n");
 }
}
```

### Clear All Performance Options

```
void DisablePerformanceOptimizations(WebSocket *ws) {
 printf("Disabling performance optimizations...\n");

 int result = 0;
 result |= ws->clroption(TCP_NODELAY);
 result |= ws->clroption(WS_SO_COMPRESS);

 if (result == 0) {
 printf("All performance options cleared\n");
 } else {
 printf("WARNING: Some options failed to clear\n");
 }
}
```

### Cleanup Before Reconnection

```
void PrepareForReconnect(WebSocket *ws) {
 // Clear all custom options before closing
 ws->clroption(WS_SO_BINARY);
 ws->clroption(TCP_NODELAY);
 ws->clroption(SO_KEEPALIVE);
 ws->clroption(WS_SO_COMPRESS);

 printf("Options cleared, ready for reconnection\n");
}
```

## 16.190.2.2 Connect() [1/4]

```
static int NB::WebSocket::Connect (
 const char * host,
 const char * resource,
 const char * protocol,
```

```
int portnum = 80,
bool useSSL = false) [static]
```

Connect to a [WebSocket](#) server using hostname with optional protocol negotiation.

Establishes a [WebSocket](#) client connection to the specified server by hostname, performing DNS resolution, TCP connection, HTTP upgrade handshake, and optional subprotocol negotiation. This is the primary method for creating client-side [WebSocket](#) connections.

### 16.190.3 Connection Process

1. Resolve hostname to IP address via DNS
2. Establish TCP connection to server:port
3. Send HTTP upgrade request with [WebSocket](#) headers
4. Negotiate subprotocol if specified
5. Complete handshake and upgrade to [WebSocket](#) protocol
6. Return [WebSocket](#) file descriptor on success

### 16.190.4 Parameters

#### Parameters

|                 |                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>host</i>     | Hostname or domain name of the <a href="#">WebSocket</a> server (e.g., "ws.example.com"). Must be a null-terminated string. DNS resolution is performed automatically.                           |
| <i>resource</i> | <a href="#">WebSocket</a> endpoint path (e.g., "/api/v1/stream", "/ws", "/chat"). Must start with "/" and be null-terminated. This is the path portion of the <a href="#">WebSocket</a> URL.     |
| <i>protocol</i> | Optional subprotocol to negotiate (e.g., "chat", "mqtt", "json"). Pass NULL for no subprotocol negotiation. If specified, the server must support and accept this protocol during the handshake. |
| <i>portnum</i>  | TCP port number for the <a href="#">WebSocket</a> connection (default: 80 for ws://, 443 for wss://). Standard ports are 80 (unencrypted) and 443 (SSL/TLS).                                     |
| <i>useSSL</i>   | Set true to use <a href="#">WebSocket</a> Secure (wss://) with TLS encryption, false for unencrypted <a href="#">WebSocket</a> (ws://). Default is false.                                        |

### 16.190.5 Return Value

Returns a [WebSocket](#) file descriptor on success (positive integer), or a negative value on failure:

- Positive value: Valid [WebSocket](#) file descriptor for use with WSRead(), WSWrite(), etc.
- Negative value: Connection failed (DNS resolution, TCP connection, or handshake failure)

### 16.190.6 Connection Failures

Common failure scenarios:

- DNS resolution failure (hostname not found)
- TCP connection timeout or refused
- HTTP upgrade rejected by server (non-101 response)
- Protocol negotiation failure (requested protocol not supported)
- No available [WebSocket](#) slots (WS\_MAX\_SOCKS limit reached)
- Invalid handshake response from server

### 16.190.7 Usage Notes

- The returned file descriptor must be closed with [close\(\)](#) when done
- Use [WSRead\(\)](#) and [WSWrite\(\)](#) for data exchange after successful connection
- Check available slots with [GetFreeWebSocketCount\(\)](#) before connecting
- Connection is blocking; consider running in a separate task for non-blocking behavior
- For wss:// (useSSL=true), ensure SSL/TLS libraries are linked and configured
- Subprotocol is optional; many [WebSocket](#) servers don't require one
- Default port 80 is typical for ws://, use 443 for wss://

---

### Expand for Example Usage

#### Examples

##### Example 1: Basic WebSocket Client Connection

```
#include <websockets.h>

void WebSocketClientTask(void *pd) {
 // Connect to WebSocket server
 int wsFd = NB::WebSocket::Connect("echo.websocket.org",
 "/",
 NULL, // No protocol
 80, // Standard port
 false); // No SSL

 if (wsFd < 0) {
 printf("Failed to connect to WebSocket server\r\n");
 return;
 }

 printf("Connected! WebSocket fd: %d\r\n", wsFd);

 // Send a message
 const char *msg = "Hello WebSocket!";
 WSWrite(wsFd, msg, strlen(msg));

 // Read response
 char buffer[256];
 int len = WSRead(wsFd, buffer, sizeof(buffer) - 1, TICKS_PER_SECOND * 5);
 if (len > 0) {
 buffer[len] = '\0';
 printf("Received: %s\r\n", buffer);
 }

 // Clean up
 close(wsFd);
 printf("Connection closed\r\n");
}
```

##### Example 2: Secure WebSocket Connection (WSS)

```
void SecureWebSocketClient(void *pd) {
 // Connect using WSS (WebSocket Secure)
 int wsFd = NB::WebSocket::Connect("api.example.com",
 "/v1/secure-stream",
 "json-api", // Subprotocol
 443, // HTTPS port
 true); // Enable SSL/TLS

 if (wsFd < 0) {
 printf("Secure connection failed\r\n");
 return;
 }

 printf("Secure WebSocket connected\r\n");

 // Send JSON data
 const char *jsonMsg = "{\"type\":\"subscribe\",\"channel\":\"updates\"}";
 ws_setopt(wsFd, WS_SO_TEXT); // Text mode for JSON
 WSWrite(wsFd, jsonMsg, strlen(jsonMsg));

 // Receive updates
 char rxBuffer[512];
 while (1) {
 int len = WSRead(wsFd, rxBuffer, sizeof(rxBuffer) - 1, TICKS_PER_SECOND * 30);
 }
```

```

 if (len > 0) {
 rxBuffer[len] = '\0';
 printf("Update: %s\r\n", rxBuffer);
 } else {
 printf("Connection closed or timeout\r\n");
 break;
 }
 }

 close(wsFd);
}

```

### Example 3: Connection with Error Handling

```

int ConnectWithRetry(const char *host, const char *resource, int maxRetries) {
 int wsFd = -1;
 int retryCount = 0;

 while (retryCount < maxRetries) {
 // Check available slots
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();
 if (freeSlots <= 0) {
 printf("No WebSocket slots available, waiting...\r\n");
 OSTimeDly(TICKS_PER_SECOND * 5);
 continue;
 }

 printf("Attempt %d/%d: Connecting to %s%s...\r\n",
 retryCount + 1, maxRetries, host, resource);

 wsFd = NB::WebSocket::Connect(host, resource, NULL, 80, false);

 if (wsFd >= 0) {
 printf("Successfully connected!\r\n");
 return wsFd;
 }

 printf("Connection failed, retrying in 5 seconds...\r\n");
 retryCount++;
 OSTimeDly(TICKS_PER_SECOND * 5);
 }

 printf("Failed to connect after %d attempts\r\n", maxRetries);
 return -1;
}

// Usage
int wsFd = ConnectWithRetry("ws.server.com", "/api/stream", 3);
if (wsFd >= 0) {
 // Use WebSocket connection
 close(wsFd);
}

```

### Example 4: Multiple Server Connections

```

struct ServerEndpoint {
 const char *host;
 const char *resource;
 const char *protocol;
 int port;
 bool useSSL;
};

void ConnectMultipleServers(void *pd) {
 ServerEndpoint servers[] = {
 {"telemetry.example.com", "/data", "json", 80, false},
 {"api.example.com", "/events", "mqtt", 443, true},
 {"stream.example.com", "/live", NULL, 80, false}
 };

 int connections[3];
 int connectedCount = 0;

 for (int i = 0; i < 3; i++) {
 printf("Connecting to %s%s...\r\n",
 servers[i].host, servers[i].resource);

 connections[i] = NB::WebSocket::Connect(servers[i].host,
 servers[i].resource,
 servers[i].protocol,
 servers[i].port,
 servers[i].useSSL);
 }
}

```

```

 if (connections[i] >= 0) {
 printf(" Connected (fd %d)\r\n", connections[i]);
 connectedCount++;
 } else {
 printf(" Connection failed\r\n");
 }
 }

 printf("Successfully connected to %d/%d servers\r\n",
 connectedCount, 3);

 // Use connections...

 // Clean up
 for (int i = 0; i < 3; i++) {
 if (connections[i] >= 0) {
 close(connections[i]);
 }
 }
}

```

### Example 5: Protocol Negotiation

```

void ConnectWithProtocol(void *pd) {
 const char *protocols[] = {"chat", "json-rpc", "mqtt"};
 int wsFd = -1;

 // Try each protocol until one succeeds
 for (int i = 0; i < 3; i++) {
 printf("Attempting connection with protocol: %s\r\n", protocols[i]);

 wsFd = NB::WebSocket::Connect("api.example.com",
 "/ws",
 protocols[i],
 80,
 false);

 if (wsFd >= 0) {
 printf("Connected with protocol: %s\r\n", protocols[i]);
 break;
 }

 printf("Protocol %s not supported, trying next...\r\n", protocols[i]);
 }

 if (wsFd < 0) {
 printf("No supported protocol found\r\n");
 return;
 }

 // Use connection with negotiated protocol
 // ...

 close(wsFd);
}

```

### Example 6: Non-blocking Connection in Task

```

void AsyncConnectTask(void *pd) {
 const char *host = "stream.example.com";
 const char *resource = "/live";

 printf("Background connection task started\r\n");

 // This blocks but runs in separate task
 int wsFd = NB::WebSocket::Connect(host, resource, NULL, 80, false);

 if (wsFd >= 0) {
 printf("Background connection established\r\n");

 // Store fd in global or notify main task
 // ... handle communication ...

 close(wsFd);
 } else {
 printf("Background connection failed\r\n");
 }
}

void StartAsyncConnection() {
 // Create task for non-blocking connection
 OSSimpleTaskCreateWithName(AsyncConnectTask,
 MAIN_PRIO - 1,

```

```

 NULL,
 "WSConnect");

 // Main thread continues without blocking
 printf("Connection initiated in background\r\n");
}

```

**See also**

[Connect\(IPADDR, const char \\*, const char \\*, int, bool\)](#) - [Connect](#) using IP address

[WSRead\(\)](#) - Read data from [WebSocket](#) connection

[WSWrite\(\)](#) - Write data to [WebSocket](#) connection

[close\(\)](#) - Close [WebSocket](#) connection

[GetFreeWebSocketCount\(\)](#) - Check available connection slots

**Note**

DNS resolution may take several seconds; consider timeout handling

Connection blocks until complete or failure; use separate task for async behavior

Ensure WS\_MAX\_SOCKS has available slots before connecting

For production systems, implement connection retry logic with exponential backoff

**16.190.7.1 Connect() [2/4]**

```

static int NB::WebSocket::Connect (
 const char * host,
 const char * resource,
 int portnum = 80,
 bool useSSL = false) [inline], [static]

```

Connect to a [WebSocket](#) server using hostname without protocol negotiation.

Convenience overload that establishes a [WebSocket](#) client connection without specifying a subprotocol. This is the most common connection method as many [WebSocket](#) servers don't require subprotocol negotiation.

**16.190.8 Parameters****Parameters**

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| <i>host</i>     | Hostname or domain name of the <a href="#">WebSocket</a> server (e.g., "ws.example.com") |
| <i>resource</i> | <a href="#">WebSocket</a> endpoint path (e.g., "/ws", "/api/stream")                     |
| <i>portnum</i>  | TCP port number (default: 80 for ws://, 443 for wss://)                                  |
| <i>useSSL</i>   | Set true for wss:// (encrypted), false for ws:// (default: false)                        |

**16.190.9 Return Value**

Returns [WebSocket](#) file descriptor (positive) on success, negative on failure.

**See also**

[Connect\(const char \\*, const char \\*, const char \\*, int, bool\)](#) - Full version with protocol

**Note**

This is equivalent to calling `Connect(host, resource, NULL, portnum, useSSL)`

Most commonly used overload for simple [WebSocket](#) connections

### 16.190.9.1 Connect() [3/4]

```
static int NB::WebSocket::Connect (
 IPADDR host,
 const char * resource,
 const char * protocol,
 int portnum = 80,
 bool useSSL = false) [static]
```

Connect to a [WebSocket](#) server using IP address with optional protocol negotiation.

Establishes a [WebSocket](#) client connection using a direct IP address, bypassing DNS resolution. This is useful for local networks, static IPs, or when DNS is unavailable. Otherwise identical to the hostname-based Connect method.

### 16.190.10 Connection Process

1. Use provided IP address directly (no DNS lookup)
2. Establish TCP connection to IP:port
3. Send HTTP upgrade request with Host header
4. Negotiate subprotocol if specified
5. Complete handshake and upgrade to [WebSocket](#)
6. Return [WebSocket](#) file descriptor on success

### 16.190.11 Parameters

#### Parameters

|                 |                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>host</i>     | IP address of the <a href="#">WebSocket</a> server as IPADDR type. Can be constructed using AsciiToIp() for dotted notation or direct IP address types. Example: AsciiToIp("192.168.1.100") or <a href="#">IPADDR(192,168,1,100)</a> |
| <i>resource</i> | <a href="#">WebSocket</a> endpoint path (e.g., "/api/v1/stream", "/ws")                                                                                                                                                              |
| <i>protocol</i> | Optional subprotocol to negotiate (NULL for none)                                                                                                                                                                                    |
| <i>portnum</i>  | TCP port number (default: 80 for ws://, 443 for wss://)                                                                                                                                                                              |
| <i>useSSL</i>   | Set true for wss:// (encrypted), false for ws:// (default: false)                                                                                                                                                                    |

### 16.190.12 Return Value

Returns [WebSocket](#) file descriptor (positive) on success, negative on failure.

### 16.190.13 Advantages of IP Address Connection

- Faster connection (no DNS resolution delay)
- Works without DNS server availability
- Deterministic connection to specific server
- Useful for local network devices with static IPs
- Avoids DNS caching issues during development

---

#### Expand for Example Usage

#### Examples

**Example 1: Connect to Local WebSocket Server**

```

void ConnectToLocalServer(void *pd) {
 // Connect to WebSocket server at 192.168.1.100
 IPADDR serverIP = AsciiToIp("192.168.1.100");

 int wsFd = NB::WebSocket::Connect(serverIP,
 "/api/data",
 NULL, // No protocol
 8080, // Custom port
 false); // No SSL

 if (wsFd < 0) {
 printf("Connection to %s failed\r\n",
 IpToString(serverIP));
 return;
 }

 printf("Connected to server at %s:%d\r\n",
 IpToString(serverIP), 8080);

 // Use connection...

 close(wsFd);
}

```

**Example 2: Connect Using Direct IP Construction**

```

void ConnectDirectIP(void *pd) {
 // Construct IP address directly
 IPADDR serverIP(192, 168, 1, 50);

 int wsFd = NB::WebSocket::Connect(serverIP,
 "/ws",
 "telemetry",
 80,
 false);

 if (wsFd >= 0) {
 printf("Connected to 192.168.1.50\r\n");

 // Send telemetry data
 char data[128];
 snprintf(data, sizeof(data),
 "{\"temp\":%.1f,\"time\":%lu}", 25.5f, Secs);
 ws_setopt(wsFd, WS_SO_TEXT);
 WSWrite(wsFd, data, strlen(data));

 close(wsFd);
 }
}

```

**Example 3: Fallback from Hostname to IP**

```

int ConnectWithFallback(const char *hostname, const char *ipStr,
 const char *resource) {
 int wsFd;

 // Try hostname first
 printf("Attempting connection to %s...\r\n", hostname);
 wsFd = NB::WebSocket::Connect(hostname, resource, NULL, 80, false);

 if (wsFd >= 0) {
 printf("Connected via hostname\r\n");
 return wsFd;
 }

 // Fallback to IP address
 printf("Hostname failed, trying IP address %s...\r\n", ipStr);
 IPADDR serverIP = AsciiToIp(ipStr);
 wsFd = NB::WebSocket::Connect(serverIP, resource, NULL, 80, false);

 if (wsFd >= 0) {
 printf("Connected via IP address\r\n");
 return wsFd;
 }

 printf("All connection attempts failed\r\n");
 return -1;
}

// Usage
int wsFd = ConnectWithFallback("server.local", "192.168.1.100", "/ws");

```

**Example 4: Connect to Multiple Devices by IP**

```

struct Device {
 const char *name;
 IPADDR ip;
 int wsFd;
};

void ConnectToDeviceArray(Device *devices, int count) {
 for (int i = 0; i < count; i++) {
 printf("Connecting to %s at %s...\r\n",
 devices[i].name, IpToString(devices[i].ip));

 devices[i].wsFd = NB::WebSocket::Connect(devices[i].ip,
 "/sensor",
 "iot-proto",
 80,
 false);

 if (devices[i].wsFd >= 0) {
 printf(" %s: Connected (fd %d)\r\n",
 devices[i].name, devices[i].wsFd);
 } else {
 printf(" %s: Connection failed\r\n", devices[i].name);
 }
 }
}

// Usage
Device sensors[] = {
 {"Temperature", AsciiToIp("192.168.1.10"), -1},
 {"Humidity", AsciiToIp("192.168.1.11"), -1},
 {"Pressure", AsciiToIp("192.168.1.12"), -1}
};
ConnectToDeviceArray(sensors, 3);

```

**Example 5: Dynamic IP Address Connection**

```

void ConnectDynamicIP(void *pd) {
 // Get IP address from configuration or discovery
 char ipString[16];
 GetServerIPFromConfig(ipString, sizeof(ipString));

 IPADDR serverIP = AsciiToIp(ipString);

 if (serverIP == IPADDR::NullIP()) {
 printf("Invalid IP address: %s\r\n", ipString);
 return;
 }

 printf("Connecting to dynamically configured server: %s\r\n",
 IpToString(serverIP));

 int wsFd = NB::WebSocket::Connect(serverIP, "/api", NULL, 80, false);

 if (wsFd >= 0) {
 printf("Connection successful\r\n");
 // Use connection...
 close(wsFd);
 } else {
 printf("Connection failed\r\n");
 }
}

```

**See also**

[Connect\(const char \\*, const char \\*, const char \\*, int, bool\)](#) - [Connect](#) using hostname

[IPADDR](#) - NetBurner IP address type

[AsciiToIp\(\)](#) - Convert dotted notation string to [IPADDR](#)

[IpToString\(\)](#) - Convert [IPADDR](#) to string for display

**Note**

No DNS lookup performed; connection is faster than hostname-based

Useful for local networks, embedded systems, and static configurations

Host header in HTTP upgrade still requires a hostname; IP is used for connection only

### 16.190.13.1 Connect() [4/4]

```
static int NB::WebSocket::Connect (
 IPADDR host,
 const char * resource,
 int portnum = 80,
 bool useSSL = false) [inline], [static]
```

Connect to a [WebSocket](#) server using IP address without protocol negotiation.

Convenience overload that establishes a [WebSocket](#) client connection using an IP address without specifying a subprotocol. Most commonly used for local network connections or when the server doesn't require protocol negotiation.

### 16.190.14 Parameters

#### Parameters

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <i>host</i>     | IP address of the <a href="#">WebSocket</a> server (IPADDR type)     |
| <i>resource</i> | <a href="#">WebSocket</a> endpoint path (e.g., "/ws", "/api/stream") |
| <i>portnum</i>  | TCP port number (default: 80 for ws://, 443 for wss://)              |
| <i>useSSL</i>   | Set true for wss:// (encrypted), false for ws:// (default: false)    |

### 16.190.15 Return Value

Returns [WebSocket](#) file descriptor (positive) on success, negative on failure.

See also

[Connect\(IPADDR, const char \\*, const char \\*, int, bool\)](#) - Full version with protocol

#### Note

This is equivalent to calling `Connect(host, resource, NULL, portnum, useSSL)`

Most commonly used for local network [WebSocket](#) connections

### 16.190.15.1 DumpSock()

```
void NB::WebSocket::DumpSock ()
```

Dump detailed state information for this [WebSocket](#) connection.

Prints comprehensive diagnostic information about the current [WebSocket](#) connection to the debug console, including connection state, buffer levels, file descriptors, timing information, and internal state variables. Useful for debugging connection issues, buffer management, and protocol state.

### 16.190.16 Displayed Information

Typical output includes:

- File descriptors (TCP and [WebSocket](#))
- Connection state (INIT, ESTABLISHED, CLOSING, etc.)
- Buffer levels (RX, TX, Control)
- Buffer statistics (used/available space)
- Socket options (text/binary mode)
- Timing information (last send, accumulation delay)
- Frame processing state
- Ping/pong state
- Masking keys and payload lengths

## 16.190.17 Usage Scenarios

- Debugging connection establishment issues
- Diagnosing buffer exhaustion problems
- Monitoring connection health and state
- Troubleshooting frame fragmentation
- Analyzing performance bottlenecks
- Verifying protocol state transitions
- Development and testing

---

### Expand for Example Usage

#### Examples

##### Example 1: Basic Connection Diagnostics

```
void DiagnoseConnection(int wsFd) {
 // Get WebSocket record
 NB::WebSocket *ws = NB::WebSocket::GetWebSocketRecord(wsFd);

 if (ws == NULL) {
 printf("Invalid WebSocket fd: %d\r\n", wsFd);
 return;
 }

 printf("=== WebSocket Diagnostics ===\r\n");
 ws->DumpSock();
 printf("=====\r\n");
}
```

##### Example 2: Debug Connection Issues

```
void DebugWebSocketCommunication(int wsFd) {
 NB::WebSocket *ws = NB::WebSocket::GetWebSocketRecord(wsFd);

 if (ws == NULL) return;

 // Check state before operation
 printf("Before write:\r\n");
 ws->DumpSock();

 // Attempt write
 const char *msg = "Test message";
 int result = WSWrite(wsFd, msg, strlen(msg));

 // Check state after operation
 printf("\nAfter write (result: %d):\r\n", result);
 ws->DumpSock();

 // Check buffer space
 int space = ws->GetWriteSpace();
 printf("\nAvailable TX buffer space: %d bytes\r\n", space);
}
```

##### Example 3: Monitor Connection Health

```
void MonitorConnectionHealth(int wsFd) {
 NB::WebSocket *ws = NB::WebSocket::GetWebSocketRecord(wsFd);

 if (ws == NULL) return;

 while (1) {
 // Periodic health check
 OSTimeDly(TICKS_PER_SECOND * 10);

 printf("\n=== Connection Health at %lu seconds ===\r\n", Secs);
 ws->DumpSock();

 // Check state
 NB::WebSocket::WS_State state = ws->GetState();
 if (state != NB::WebSocket::WS_ESTABLISHED) {
 printf("WARNING: Connection not established!\r\n");
 break;
 }
 }
}
```

```

 // Check buffer levels
 int space = ws->GetWriteSpace();
 if (space < 100) {
 printf("WARNING: Low TX buffer space (%d bytes)\r\n", space);
 }
 }
}

```

#### Example 4: Debugging Message Send Failure

```

void DebugSendFailure(int wsFd, const char *data, int len) {
 NB::WebSocket *ws = NB::WebSocket::GetWebSocketRecord(wsFd);

 if (ws == NULL) {
 printf("Invalid WebSocket\r\n");
 return;
 }

 printf("Attempting to send %d bytes...\r\n", len);

 // Check pre-send state
 int spaceBefore = ws->GetWriteSpace();
 printf("TX buffer space before: %d bytes\r\n", spaceBefore);

 if (spaceBefore < len) {
 printf("ERROR: Insufficient buffer space!\r\n");
 printf("Detailed state:\r\n");
 ws->DumpSock();
 return;
 }

 // Attempt send
 int sent = WSWrite(wsFd, data, len);

 if (sent < 0) {
 printf("Send failed! Dumping state:\r\n");
 ws->DumpSock();
 } else if (sent < len) {
 printf("Partial send: %d/%d bytes\r\n", sent, len);
 ws->DumpSock();
 } else {
 printf("Send successful\r\n");
 }
}

```

#### Example 5: Connection State Verification

```

void VerifyConnectionState(int wsFd, const char *operationName) {
 NB::WebSocket *ws = NB::WebSocket::GetWebSocketRecord(wsFd);

 if (ws == NULL) {
 printf("%s: Invalid WebSocket fd\r\n", operationName);
 return;
 }

 NB::WebSocket::WS_State state = ws->GetState();

 printf("\n=== %s: State Verification ===\r\n", operationName);
 ws->DumpSock();

 switch (state) {
 case NB::WebSocket::WS_ESTABLISHED:
 printf("Status: OK - Connection ready\r\n");
 break;

 case NB::WebSocket::WS_CONNECTING:
 printf("Status: WARNING - Still connecting\r\n");
 break;

 case NB::WebSocket::WS_CLOSE_PENDING:
 case NB::WebSocket::WS_CLOSE_SENT:
 case NB::WebSocket::WS_CLOSE_RECV:
 printf("Status: WARNING - Connection closing\r\n");
 break;

 case NB::WebSocket::WS_CLOSED:
 case NB::WebSocket::WS_FAIL:
 printf("Status: ERROR - Connection closed/failed\r\n");
 break;

 default:
 printf("Status: UNKNOWN - Unexpected state\r\n");
 }
}

```

```
 break;
 }
}
```

---

#### See also

[DumpSockets\(\)](#) - Dump state of all [WebSocket](#) connections  
[GetState\(\)](#) - Get current connection state  
[GetWriteSpace\(\)](#) - Get available TX buffer space  
[GetWebSocketRecord\(\)](#) - Get [WebSocket](#) object from file descriptor

#### Note

Output is sent to debug console (printf/serial)  
Useful during development and testing  
Can be called at any time during connection lifetime  
For production code, consider removing or conditionally compiling debug calls  
Not thread-safe; use appropriate synchronization if called from multiple tasks

#### 16.190.17.1 DumpSockets()

```
static void NB::WebSocket::DumpSockets () [static]
```

Dump detailed state information for all active [WebSocket](#) connections.

Prints comprehensive diagnostic information for all [WebSocket](#) connections in the WSSockStructs array to the debug console. This includes both active and inactive slots, showing the overall state of the [WebSocket](#) subsystem. Useful for system-wide debugging and monitoring.

#### 16.190.18 Displayed Information

For each [WebSocket](#) slot (0 to WS\_MAX\_SOCKS-1):

- Slot index and active status
- File descriptors (TCP and [WebSocket](#))
- Connection state
- Buffer levels and statistics
- Socket options and configuration
- Timing and protocol state
- Summary of active vs free connections

#### 16.190.19 Usage Scenarios

- System-wide connection monitoring
- Debugging connection leaks or exhaustion
- Verifying connection cleanup
- Analyzing resource usage
- Development and testing of multi-connection applications
- Troubleshooting "no available slots" errors
- System health checks

---

#### Expand for Example Usage Examples

**Example 1: System Health Check**

```

void SystemHealthCheck(void *pd) {
 while (1) {
 // Periodic system-wide diagnostic
 OSTimeDly(TICKS_PER_SECOND * 60);

 printf("\n=====r\n");
 printf("WebSocket System Status at %lu seconds\r\n", Secs);
 printf("=====r\n");

 NB::WebSocket::DumpSockets();

 int freeCount = NB::WebSocket::GetFreeWebSocketCount();
 printf("\nSummary: %d free slots, %d in use\r\n",
 freeCount, WS_MAX_SOCKS - freeCount);
 printf("=====r\n\n");
 }
}

```

**Example 2: Debug Connection Exhaustion**

```

void DebugConnectionExhaustion() {
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();

 if (freeSlots <= 0) {
 printf("n!!! NO WEBSOCKET SLOTS AVAILABLE !!!r\n");
 printf("Dumping all connections to identify issue:r\n\n");

 NB::WebSocket::DumpSockets();

 printf("\nPossible causes:r\n");
 printf("- Connections not being closed properly\r\n");
 printf("- Connection leaks in application code\r\n");
 printf("- WS_MAX_SOCKS (%d) too low for application needs\r\n",
 WS_MAX_SOCKS);
 printf("- Connections stuck in non-terminal states\r\n");
 } else {
 printf("%d WebSocket slots available\r\n", freeSlots);
 }
}

```

**Example 3: Monitor Connection Lifecycle**

```

void MonitorConnectionLifecycle() {
 printf("Initial state:r\n");
 NB::WebSocket::DumpSockets();

 // Create some connections
 int ws1 = NB::WebSocket::Connect("server1.com", "/ws", 80);
 printf("\nAfter connecting to server1:r\n");
 NB::WebSocket::DumpSockets();

 int ws2 = NB::WebSocket::Connect("server2.com", "/api", 80);
 printf("\nAfter connecting to server2:r\n");
 NB::WebSocket::DumpSockets();

 // Use connections...
 OSTimeDly(TICKS_PER_SECOND * 5);

 // Close first connection
 close(ws1);
 printf("\nAfter closing server1 connection:r\n");
 NB::WebSocket::DumpSockets();

 // Close second connection
 close(ws2);
 printf("\nAfter closing server2 connection:r\n");
 NB::WebSocket::DumpSockets();
}

```

**Example 4: Find Stuck Connections**

```

void FindStuckConnections() {
 printf("Searching for stuck connections...r\n\n");

 NB::WebSocket::DumpSockets();

 // Analyze the output
 printf("\nAnalyzing connection states:r\n");
}

```

```

for (int i = 0; i < WS_MAX_SOCKS; i++) {
 NB::WebSocket *ws = &NB::WebSocket::WSSockStructs[i];

 if (ws->m_fd_ws >= 0) { // Active connection
 NB::WebSocket::WS_State state = ws->GetState();

 if (state == NB::WebSocket::WS_CLOSE_PENDING ||
 state == NB::WebSocket::WS_CLOSE_SENT) {
 printf(" Slot %d: Stuck in closing state\r\n", i);
 } else if (state == NB::WebSocket::WS_CONNECTING) {
 printf(" Slot %d: Stuck in connecting state\r\n", i);
 }
 }
}
}
}

```

#### Example 5: Application Startup Verification

```

void VerifyWebSocketSubsystem() {
 printf("Verifying WebSocket subsystem initialization...\r\n");

 // Check initial state
 int freeCount = NB::WebSocket::GetFreeWebSocketCount();

 if (freeCount != WS_MAX_SOCKS) {
 printf("WARNING: Expected %d free slots, found %d\r\n",
 WS_MAX_SOCKS, freeCount);
 printf("Dumping connections:\r\n");
 NB::WebSocket::DumpSockets();
 } else {
 printf("OK: All %d WebSocket slots available\r\n", WS_MAX_SOCKS);
 }
}

```

#### Example 6: Debug Handler for Console Command

```

// Console command handler for runtime diagnostics
void HandleWSDumpCommand(void) {
 printf("\n");
 printf("=====\r\n");
 printf(" WebSocket Diagnostic Dump\r\n");
 printf(" Time: %lu seconds\r\n", Secs);
 printf("=====\r\n");

 // Show system stats
 int freeCount = NB::WebSocket::GetFreeWebSocketCount();
 int activeCount = WS_MAX_SOCKS - freeCount;

 printf("Active connections: %d/%d\r\n", activeCount, WS_MAX_SOCKS);
 printf("Free slots: %d\r\n", freeCount);

 // Dump all connections
 NB::WebSocket::DumpSockets();

 printf("\n=====\r\n");
}

// Register in UserMain
void UserMain(void *pd) {
 init();
 // ... other initialization ...

 // Register debug command
 RegisterConsoleCommand("wsdump", HandleWSDumpCommand);

 while (1) {
 OSTimeDly(TICKS_PER_SECOND);
 }
}

```

#### See also

- [DumpSock\(\)](#) - Dump state of single [WebSocket](#) connection
- [GetFreeWebSocketCount\(\)](#) - Get number of available connection slots
- [WSSockStructs](#) - Static array of all [WebSocket](#) structures
- [WS\\_MAX\\_SOCKS](#) - Maximum number of [WebSocket](#) connections

**Note**

Output is sent to debug console (printf/serial)  
Can generate significant output (all WS\_MAX\_SOCKS slots)  
Useful during development, testing, and troubleshooting  
Consider removing or conditionally compiling for production  
Not thread-safe; use appropriate synchronization if needed  
Inactive slots are also displayed for complete system view

**16.190.19.1 Flush()**

```
void NB::WebSocket::Flush ()
```

Flush buffered transmit data to the network.

This member function forces any pending data in the [WebSocket](#)'s transmit buffer to be sent immediately to the peer over the network. Normally, the [WebSocket](#) implementation may buffer small amounts of data to optimize network usage through packet coalescing, but this function overrides that behavior to ensure immediate transmission.

The flush operation is essential for:

- Ensuring critical messages are sent without delay
- Completing data transmission before closing a connection
- Real-time applications requiring immediate delivery
- Interactive protocols with strict timing requirements
- Preventing buffer buildup in high-throughput scenarios
- Coordinating with time-sensitive operations

The function blocks until the buffer contents have been passed to the underlying TCP/IP stack, though actual network transmission depends on network conditions and the peer's receive capability.

**Note**

This function blocks until the flush operation completes or a timeout occurs. The duration depends on buffer size and network speed.

Flushing does not guarantee the peer has received the data, only that it has been transmitted from the local buffer.

**Warning**

Excessive flushing can reduce network efficiency by preventing optimal packet coalescing. Use only when immediate transmission is required.

**See also**

[GetWriteSpace\(\)](#) to check buffer space before writing  
[write\(\)](#) for sending data to the [WebSocket](#)

**Example Usage**

---

**Expand for Example Usage Examples**

### Basic Flush After Write

```
WebSocket *ws = GetActiveWebSocket();

// Send data
const char *message = "Critical alert message";
ws->write(message, strlen(message));

// Ensure it's sent immediately
ws->Flush();
printf("Message flushed to network\n");
```

### Flush Before Closing Connection

```
void CloseWebSocketGracefully(WebSocket *ws) {
 // Send final goodbye message
 ws->write("Connection closing", 18);

 // Ensure message is sent before closing
 ws->Flush();

 // Brief delay to allow network transmission
 OSTimeDly(TICKS_PER_SECOND / 10);

 // Now safe to close
 ws->close();

 printf("Connection closed gracefully\n");
}
```

### Real-Time Data Streaming

```
void StreamSensorData(WebSocket *ws) {
 while (IsStreamingActive()) {
 // Read sensor values
 float temperature = ReadTemperatureSensor();
 float pressure = ReadPressureSensor();

 // Format data
 char buffer[128];
 snprintf(buffer, sizeof(buffer),
 "{\temp\":%.2f,\tpressure\":%.2f}",
 temperature, pressure);

 // Send and flush for real-time delivery
 ws->write(buffer, strlen(buffer));
 ws->Flush();

 // Wait for next sample
 OSTimeDly(TICKS_PER_SECOND);
 }
}
```

### Command-Response Pattern

```
void HandleCommand(WebSocket *ws, const char *command) {
 char response[256];

 // Process command
 ProcessCommand(command, response, sizeof(response));

 // Send response
 ws->write(response, strlen(response));

 // Flush to ensure prompt delivery to client
 ws->Flush();

 printf("Command response sent and flushed\n");
}
```

### Batch Transmission with Final Flush

```
void SendBatchMessages(WebSocket *ws, const char **messages, int count) {
 printf("Sending batch of %d messages...\n", count);

 // Send all messages
 for (int i = 0; i < count; i++) {
 ws->write(messages[i], strlen(messages[i]));
 }

 // Single flush at the end for efficiency
 ws->Flush();

 printf("Batch sent and flushed\n");
}
```

### Interactive Chat Application

```
void SendChatMessage(WebSocket *ws, const char *user, const char *message) {
 char formatted[512];

 // Format chat message with timestamp
 snprintf(formatted, sizeof(formatted),
 "{\"time\":%lu,\"user\":\"%s\",\"msg\":\"%s\"}",
 Secs, user, message);

 // Send immediately for interactive feel
 ws->write(formatted, strlen(formatted));
 ws->Flush();
}
```

### Emergency Alert System

```
void SendEmergencyAlert(WebSocket *ws, const char *alert_type,
 const char *details) {
 char alert[256];

 snprintf(alert, sizeof(alert),
 "{\"type\":\"EMERGENCY\",\"alert\":\"%s\",\"details\":\"%s\"}",
 alert_type, details);

 // Critical message - send immediately
 ws->write(alert, strlen(alert));
 ws->Flush();

 printf("EMERGENCY alert sent: %s\n", alert_type);
}
```

### Periodic Status Updates

```
void StatusUpdateTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;

 while (1) {
 if (ws->GetState() == WS_STATE_OPEN) {
 // Gather system status
 char status[256];
 GetSystemStatus(status, sizeof(status));

 // Send status update
 ws->write(status, strlen(status));
 ws->Flush();

 printf("Status update sent\n");
 }

 // Update every 10 seconds
 OSTimeDly(TICKS_PER_SECOND * 10);
 }
}
```

### Flow Control with Flush

```
bool SendLargeDataWithFlush(WebSocket *ws, const char *data, int length) {
 const int CHUNK_SIZE = 1024;
 int bytes_sent = 0;

 while (bytes_sent < length) {
 // Check available buffer space
 int space = ws->GetWriteSpace();

 if (space < 256) {
 // Low on space, flush to make room
 printf("Flushing buffer (space: %d bytes)\n", space);
 ws->Flush();
 OSTimeDly(TICKS_PER_SECOND / 10);
 }

 // Send next chunk
 int to_send = (length - bytes_sent);
 if (to_send > CHUNK_SIZE) {
 to_send = CHUNK_SIZE;
 }

 ws->write(data + bytes_sent, to_send);
 bytes_sent += to_send;
 }

 // Final flush
 ws->Flush();
 printf("Large data transfer complete: %d bytes\n", bytes_sent);
}
```

```

 return true;
 }

```

### Conditional Flush Based on Priority

```

void SendMessage(WebSocket *ws, const char *msg, bool high_priority) {
 ws->write(msg, strlen(msg));

 if (high_priority) {
 // Flush immediately for high priority messages
 ws->Flush();
 printf("High priority message flushed\n");
 } else {
 // Let normal priority messages be buffered
 printf("Normal priority message buffered\n");
 }
}

```

#### 16.190.19.2 GetFlushTime()

static void NB::WebSocket::GetFlushTime () [static]  
 Updates the global flush timing for [WebSocket](#) message delivery.

#### 16.190.20 Description

This static function updates timing-related variables that control when buffered [WebSocket](#) messages should be flushed to the network. It helps optimize message batching and delivery by determining appropriate flush intervals based on system conditions, message priorities, or application requirements.

#### 16.190.21 Usage Notes

- Typically called periodically or when flush timing needs recalculation
- May read system time (Secs, TimeTick) to update timing thresholds
- Used to implement Nagle-like algorithms for message coalescing
- Should be lightweight as it may be called frequently
- May update static/global timing variables used by flush logic

#### 16.190.22 Flush Timing Strategies

Common timing strategies include:

- Fixed interval flushing (e.g., every 100ms)
- Adaptive timing based on message rate
- Priority-based immediate vs. delayed flush
- Buffer-size threshold triggers

#### 16.190.23 Thread Safety

If timing variables are accessed from multiple contexts, appropriate synchronization must be used.

#### 16.190.24 See Also

- [ws\\_write\\_notify\(\)](#) - Uses flush timing to control message delivery
- Message buffering and coalescing functions
- Secs, TimeTick - NetBurner timing variables

#### Expand for Example Usage Examples

**Example 1: Fixed Interval Flush Timing**

```

class WebSocketManager {
private:
 static uint32_t nextFlushTime;
 static const uint32_t FLUSH_INTERVAL_MS = 100;

 static void GetFlushTime() {
 // Update next flush time to current time + interval
 nextFlushTime = TimeTick + (FLUSH_INTERVAL_MS * TICKS_PER_SECOND / 1000);
 }

public:
 static bool ShouldFlush() {
 return (TimeTick >= nextFlushTime);
 }

 static void Initialize() {
 GetFlushTime(); // Set initial flush time
 }
};

uint32_t WebSocketManager::nextFlushTime = 0;

```

**Example 2: Adaptive Flush Timing Based on Load**

```

static uint32_t flushIntervalTicks = TICKS_PER_SECOND / 10; // Default 100ms
static uint32_t lastFlushTime = 0;
static uint32_t messagesSinceFlush = 0;

static void GetFlushTime() {
 uint32_t currentTime = TimeTick;

 // Calculate time since last flush
 uint32_t elapsedTicks = currentTime - lastFlushTime;

 // Adapt interval based on message rate
 if (messagesSinceFlush > 100 && elapsedTicks < flushIntervalTicks) {
 // High message rate - flush more frequently
 flushIntervalTicks = flushIntervalTicks / 2;
 if (flushIntervalTicks < TICKS_PER_SECOND / 100) {
 flushIntervalTicks = TICKS_PER_SECOND / 100; // Min 10ms
 }
 }
 else if (messagesSinceFlush < 10 && elapsedTicks > flushIntervalTicks) {
 // Low message rate - flush less frequently
 flushIntervalTicks = flushIntervalTicks * 2;
 if (flushIntervalTicks > TICKS_PER_SECOND) {
 flushIntervalTicks = TICKS_PER_SECOND; // Max 1 second
 }
 }

 lastFlushTime = currentTime;
 messagesSinceFlush = 0;
}

```

**Example 3: Priority-Based Flush Timing**

```

struct FlushTiming {
 uint32_t normalFlushTime;
 uint32_t priorityFlushTime;
 uint32_t idleFlushTime;
 bool hasPriorityMessages;
};

static FlushTiming globalFlushTiming;

static void GetFlushTime() {
 uint32_t currentTime = TimeTick;

 // Update timing based on message priorities in queue
 if (globalFlushTiming.hasPriorityMessages) {
 // Priority messages - flush immediately
 globalFlushTiming.priorityFlushTime = currentTime;
 printf("Priority flush scheduled immediately\r\n");
 }
 else if (GetQueuedMessageCount() > 50) {
 // Many messages - flush soon (50ms)
 globalFlushTiming.normalFlushTime = currentTime + (TICKS_PER_SECOND / 20);
 }
 else if (GetQueuedMessageCount() > 0) {
 // Few messages - batch for efficiency (200ms)
 globalFlushTiming.normalFlushTime = currentTime + (TICKS_PER_SECOND / 5);
 }
 else {
 // Idle - flush any stale data (1 second)
 globalFlushTiming.idleFlushTime = currentTime + TICKS_PER_SECOND;
 }
}

```

```
 }
}
```

#### Example 4: Integration with Periodic Update Task

```
void WebSocketUpdateTask(void* pd) {
 while (1) {
 // Update flush timing every 50ms
 OSTimeDly(TICKS_PER_SECOND / 20);

 GetFlushTime();

 // Check if flush is needed
 if (ShouldFlushNow()) {
 FlushAllConnections();
 }
 }
}

void StartWebSocketManager() {
 // Initialize timing
 GetFlushTime();

 // Start update task
 OSTaskCreate(WebSocketUpdateTask,
 nullptr,
 &TaskStack[USER_TASK_STK_SIZE],
 TaskStack,
 WS_UPDATE_TASK_PRIO);
}
```

#### 16.190.24.1 GetFreeWebSocketCount()

```
static int NB::WebSocket::GetFreeWebSocketCount () [static]
```

Get the number of available [WebSocket](#) connection slots.

Returns the count of free (unused) [WebSocket](#) connection slots available for new connections. This is useful for checking resource availability before attempting to create new connections, preventing "no slots available" errors.

#### 16.190.25 Return Value

Returns the number of free connection slots (0 to WS\_MAX\_SOCKS):

- WS\_MAX\_SOCKS: All slots free, no active connections
- 1 to WS\_MAX\_SOCKS-1: Some slots free, some in use
- 0: All slots in use, cannot accept new connections

#### 16.190.26 Usage Guidelines

- Check before calling [Connect\(\)](#) or [WSUpgrade\(\)](#) to avoid failures
- Monitor resource usage in multi-connection applications
- Implement connection limits and queuing strategies
- Use for load shedding and resource management
- Display in status interfaces and diagnostics

#### Expand for Example Usage

#### Examples

**Example 1: Check Before Connecting**

```

void SafeConnect(const char *host, const char *resource) {
 // Check if slots available
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();

 if (freeSlots <= 0) {
 printf("Cannot connect: No WebSocket slots available\r\n");
 printf("Active connections: %d/%d\r\n",
 WS_MAX_SOCKETS, WS_MAX_SOCKETS);
 return;
 }

 printf("Connecting (%d slots available)...\r\n", freeSlots);
 int wsFd = NB::WebSocket::Connect(host, resource, NULL, 80, false);

 if (wsFd >= 0) {
 printf("Connected successfully (fd %d)\r\n", wsFd);
 printf("Remaining slots: %d\r\n",
 NB::WebSocket::GetFreeWebSocketCount());
 } else {
 printf("Connection failed\r\n");
 }
}

```

**Example 2: Server Connection Limit**

```

int HandleWebSocketUpgrade(HTTP_Request *req, int sock) {
 // Reserve one slot for admin/priority connections
 const int RESERVED_SLOTS = 1;
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();

 if (freeSlots <= RESERVED_SLOTS) {
 printf("Rejecting connection: Only %d slots free (need %d reserved)\r\n",
 freeSlots, RESERVED_SLOTS);

 writestring(sock, "HTTP/1.1 503 Service Unavailable\r\n");
 writestring(sock, "Content-Type: text/plain\r\n\r\n");
 writestring(sock, "Server at capacity");
 return -1;
 }

 printf("Accepting WebSocket (%d slots remaining)\r\n",
 freeSlots - 1);

 if (WSUpgrade(req, sock) >= 0) {
 OSSimpleTaskCreateName(WebSocketTask, MAIN_PRIO - 1,
 (void *) (intptr_t) sock, "WSTask");
 return 0;
 }

 return -1;
}

```

**Example 3: Connection Queue Management**

```

#define MAX_QUEUED_CONNECTIONS 10

struct QueuedConnection {
 char host[64];
 char resource[64];
 bool pending;
};

QueuedConnection connQueue[MAX_QUEUED_CONNECTIONS];
int queueCount = 0;
OS_CRIT queueCrit;

void QueueConnection(const char *host, const char *resource) {
 OSCritEnter(&queueCrit, TICKS_PER_SECOND);

 if (queueCount >= MAX_QUEUED_CONNECTIONS) {
 printf("Connection queue full\r\n");
 OSCritLeave(&queueCrit);
 return;
 }

 strncpy(connQueue[queueCount].host, host, 63);
 strncpy(connQueue[queueCount].resource, resource, 63);
 connQueue[queueCount].pending = true;
 queueCount++;
}

```

```

 OSCritLeave(&queueCrit);
 printf("Connection queued (%d in queue)\r\n", queueCount);
}

void ProcessConnectionQueue(void *pd) {
 while (1) {
 OSTimeDly(TICKS_PER_SECOND);

 // Check if we can process queued connections
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();

 if (freeSlots > 0 && queueCount > 0) {
 OSCritEnter(&queueCrit, TICKS_PER_SECOND);

 printf("Processing queue (%d pending, %d slots)\r\n",
 queueCount, freeSlots);

 for (int i = 0; i < queueCount && freeSlots > 0; i++) {
 if (connQueue[i].pending) {
 int wsFd = NB::WebSocket::Connect(connQueue[i].host,
 connQueue[i].resource,
 NULL, 80, false);

 if (wsFd >= 0) {
 printf("Queued connection established\r\n");
 connQueue[i].pending = false;
 freeSlots--;
 }
 }
 }

 // Compact queue
 int newCount = 0;
 for (int i = 0; i < queueCount; i++) {
 if (connQueue[i].pending) {
 if (i != newCount) {
 connQueue[newCount] = connQueue[i];
 }
 newCount++;
 }
 }
 queueCount = newCount;

 OSCritLeave(&queueCrit);
 }
 }
}

```

#### Example 4: Resource Usage Display

```

void DisplayWebSocketStatus() {
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();
 int usedSlots = WS_MAX_SOCKS - freeSlots;
 int percentUsed = (usedSlots * 100) / WS_MAX_SOCKS;

 printf("WebSocket Resource Usage:\r\n");
 printf(" Active: %d/%d (%d%%)\r\n",
 usedSlots, WS_MAX_SOCKS, percentUsed);
 printf(" Free: %d\r\n", freeSlots);

 // Visual bar
 printf(" [");
 for (int i = 0; i < WS_MAX_SOCKS; i++) {
 printf(i < usedSlots ? "#" : "-");
 }
 printf("]\r\n");

 // Warning for high usage
 if (percentUsed >= 75) {
 printf(" WARNING: High resource usage!\r\n");
 }
}

```

#### Example 5: Adaptive Connection Strategy

```

typedef enum {
 STRATEGY_AGGRESSIVE, // Use all available slots
 STRATEGY_CONSERVATIVE, // Keep some slots reserved
 STRATEGY_MINIMAL // Use minimal connections
} ConnectionStrategy;

int GetMaxAllowedConnections(ConnectionStrategy strategy) {
 int freeSlots = NB::WebSocket::GetFreeWebSocketCount();
}

```

```

switch (strategy) {
 case STRATEGY_AGGRESSIVE:
 // Use all but one slot
 return (freeSlots > 1) ? (WS_MAX_SOCKS - 1) : 0;

 case STRATEGY_CONSERVATIVE:
 // Use up to 75% of total
 return (WS_MAX_SOCKS * 3) / 4;

 case STRATEGY_MINIMAL:
 // Use up to 50% of total
 return WS_MAX_SOCKS / 2;

 default:
 return 0;
}

bool CanCreateConnection(ConnectionStrategy strategy) {
 int maxAllowed = GetMaxAllowedConnections(strategy);
 int currentUsed = WS_MAX_SOCKS - NB::WebSocket::GetFreeWebSocketCount();

 return currentUsed < maxAllowed;
}

```

#### Example 6: Periodic Resource Monitoring

```

void MonitorWebSocketResources(void *pd) {
 int lastFree = -1;

 while (1) {
 OSTimeDly(TICKS_PER_SECOND * 5);

 int freeNow = NB::WebSocket::GetFreeWebSocketCount();

 // Report changes
 if (freeNow != lastFree) {
 printf("WebSocket slots changed: %d -> %d free\r\n",
 lastFree, freeNow);

 if (freeNow == 0) {
 printf("ALERT: All WebSocket slots in use!\r\n");
 NB::WebSocket::DumpSockets();
 } else if (freeNow == WS_MAX_SOCKS) {
 printf("INFO: All WebSocket slots now free\r\n");
 }

 lastFree = freeNow;
 }
 }
}

```

#### See also

[WS\\_MAX\\_SOCKS](#) - Maximum number of [WebSocket](#) connections  
[Connect\(\)](#) - Create new [WebSocket](#) client connection  
[WSUpgrade\(\)](#) - Upgrade HTTP connection to [WebSocket](#) (server-side)  
[DumpSockets\(\)](#) - Display state of all connections  
[s\\_openSocketCount](#) - Static member tracking open connection count

#### Note

Return value indicates available slots, not necessarily successful connection  
 Value can change between check and connection attempt (race condition in multi-threaded)  
 Always handle connection failure even if slots appear available  
 Thread-safe; uses internal synchronization

#### 16.190.26.1 getopt()

```
int NB::WebSocket::getoption ()
```

Get the current socket options bitmap.

### Returns

int A bitmask of currently enabled socket options, or negative value on failure

This member function retrieves the current state of all socket options for this [WebSocket](#) connection. It returns a bitmask where each bit represents a specific socket option's state (enabled/disabled).

The returned value can be tested against specific option flags using bitwise AND operations to determine if particular options are currently enabled.

Common uses include:

- Debugging socket configuration
- Verifying option settings after configuration
- Conditionally changing options based on current state
- Logging and diagnostics
- Saving/restoring socket configuration

Example option flags that may be present in the bitmask:

- WS\_SO\_TEXT: Text frame mode enabled
- WS\_SO\_BINARY: Binary frame mode enabled
- TCP\_NODELAY: Nagle's algorithm disabled
- SO\_KEEPALIVE: TCP keepalive enabled
- WS\_SO\_COMPRESS: Compression enabled

### Note

The exact interpretation of the bitmask depends on the [WebSocket](#) implementation and which options are supported.

The returned bitmask is a snapshot of the current state. It may change as options are set or cleared.

### See also

[setoption\(\)](#) for setting socket options

[clroption\(\)](#) for clearing socket options

### Example Usage

---

#### Expand for Example Usage

##### Examples

###### Query Current Options

```
WebSocket *ws = GetActiveWebSocket();

int options = ws->getoption();
if (options >= 0) {
 printf("Current socket options: 0x%08X\n", options);
} else {
 printf("Failed to get socket options\n");
}
```

### Check Specific Option

```

WebSocket *ws = GetActiveWebSocket();
int options = ws->getoption();

if (options >= 0) {
 if (options & WS_SO_BINARY) {
 printf("WebSocket is in BINARY mode\n");
 } else if (options & WS_SO_TEXT) {
 printf("WebSocket is in TEXT mode\n");
 } else {
 printf("WebSocket mode unknown\n");
 }

 if (options & TCP_NODELAY) {
 printf("Low latency mode: Nagle's algorithm DISABLED\n");
 } else {
 printf("Buffering mode: Nagle's algorithm ENABLED\n");
 }

 if (options & SO_KEEPALIVE) {
 printf("TCP keepalive: ENABLED\n");
 } else {
 printf("TCP keepalive: DISABLED\n");
 }
}

```

### Conditional Option Setting

```

void EnsureBinaryModeEnabled(WebSocket *ws) {
 int options = ws->getoption();

 if (options < 0) {
 printf("ERROR: Cannot read socket options\n");
 return;
 }

 // Only set binary mode if not already enabled
 if (!(options & WS_SO_BINARY)) {
 ws->setoption(WS_SO_BINARY);
 printf("Binary mode was disabled, now enabled\n");
 } else {
 printf("Binary mode already enabled\n");
 }
}

```

### Diagnostic Logging

```

void LogWebSocketConfiguration(WebSocket *ws) {
 int options = ws->getoption();

 if (options < 0) {
 printf("ERROR: Could not retrieve socket options\n");
 return;
 }

 printf("=== WebSocket Configuration ===\n");
 printf("Frame Mode:\n");
 printf(" WS_SO_TEXT: %s\n", (options & WS_SO_TEXT) ? "ON" : "OFF");
 printf(" WS_SO_BINARY: %s\n", (options & WS_SO_BINARY) ? "ON" : "OFF");
 printf("TCP Options:\n");
 printf(" SO_KEEPALIVE: %s\n", (options & SO_KEEPALIVE) ? "ON" : "OFF");
 printf(" TCP_NODELAY: %s\n", (options & TCP_NODELAY) ? "ON" : "OFF");
 printf("Features:\n");
 printf(" WS_SO_COMPRESS:%s\n", (options & WS_SO_COMPRESS) ? "ON" : "OFF");
 printf("Raw bitmask: 0x%08X\n", options);
 printf("=====\n");
}

```

### Compare Configurations

```

void CompareWebSocketOptions(WebSocket *ws1, WebSocket *ws2) {
 int options1 = ws1->getoption();
 int options2 = ws2->getoption();

 if (options1 < 0 || options2 < 0) {
 printf("ERROR: Could not retrieve options for comparison\n");
 return;
 }

 if (options1 == options2) {
 printf("Both WebSockets have identical options (0x%08X)\n",
 options1);
 } else {
 printf("WebSocket options differ:\n");
 }
}

```

```

 printf(" WS1: 0x%08X\n", options1);
 printf(" WS2: 0x%08X\n", options2);

 int diff = options1 ^ options2;
 printf(" Differences: 0x%08X\n", diff);

 // Show which specific options differ
 if (diff & WS_SO_BINARY) {
 printf(" - Binary mode differs\n");
 }
 if (diff & TCP_NODELAY) {
 printf(" - TCP_NODELAY differs\n");
 }
 if (diff & SO_KEEPALIVE) {
 printf(" - Keepalive differs\n");
 }
}
}

```

### Save and Restore Configuration

```

int SaveWebSocketConfig(WebSocket *ws) {
 int saved_options = ws->getoption();

 if (saved_options >= 0) {
 printf("Configuration saved: 0x%08X\n", saved_options);
 }

 return saved_options;
}

void RestoreWebSocketConfig(WebSocket *ws, int saved_options) {
 if (saved_options < 0) {
 printf("Invalid saved configuration\n");
 return;
 }

 // Clear all options first
 ws->clroption(WS_SO_BINARY);
 ws->clroption(WS_SO_TEXT);
 ws->clroption(TCP_NODELAY);
 ws->clroption(SO_KEEPALIVE);
 ws->clroption(WS_SO_COMPRESS);

 // Restore saved options
 if (saved_options & WS_SO_BINARY) ws->setoption(WS_SO_BINARY);
 if (saved_options & WS_SO_TEXT) ws->setoption(WS_SO_TEXT);
 if (saved_options & TCP_NODELAY) ws->setoption(TCP_NODELAY);
 if (saved_options & SO_KEEPALIVE) ws->setoption(SO_KEEPALIVE);
 if (saved_options & WS_SO_COMPRESS) ws->setoption(WS_SO_COMPRESS);

 printf("Configuration restored: 0x%08X\n", saved_options);
}

// Usage:
int saved = SaveWebSocketConfig(ws);
// ... modify options ...
RestoreWebSocketConfig(ws, saved);

```

### Verify Configuration After Setup

```

bool VerifyWebSocketSetup(WebSocket *ws, int expected_options) {
 int actual_options = ws->getoption();

 if (actual_options < 0) {
 printf("ERROR: Cannot verify configuration\n");
 return false;
 }

 if ((actual_options & expected_options) == expected_options) {
 printf("Configuration verified successfully\n");
 return true;
 } else {
 printf("Configuration mismatch!\n");
 printf(" Expected: 0x%08X\n", expected_options);
 printf(" Actual: 0x%08X\n", actual_options);
 printf(" Missing: 0x%08X\n",
 expected_options & ~actual_options);
 return false;
 }
}

// Usage:
ws->setoption(WS_SO_BINARY | TCP_NODELAY);
VerifyWebSocketSetup(ws, WS_SO_BINARY | TCP_NODELAY);

```

### Runtime Option Monitoring

```
void MonitorWebSocketOptions(WebSocket *ws) {
 static int last_options = -1;

 int current_options = ws->getoption();

 if (current_options >= 0) {
 if (current_options != last_options) {
 printf("Options changed: 0x%08X -> 0x%08X\n",
 last_options, current_options);
 LogWebSocketConfiguration(ws);
 last_options = current_options;
 }
 }
}
```

---

#### 16.190.26.2 GetPingReplyTick()

```
int NB::WebSocket::GetPingReplyTick (
 uint32_t * replyTick)
```

Get the tick count when the last pong was received.

##### Parameters

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <i>replyTick</i> | Pointer to variable to receive the tick count of last pong reception |
|------------------|----------------------------------------------------------------------|

##### Returns

int Returns 0 on success with valid tick count, negative value on error

This function retrieves the system tick count (from TimeTick) at the moment the most recent pong frame was received. This timestamp can be used in conjunction with the ping send timestamp from [Ping\(\)](#) to calculate precise round-trip time.

The function is useful for:

- Calculating round-trip time (RTT) measurements
- Verifying pong reception without blocking
- Implementing non-blocking ping-pong monitoring
- Logging network performance metrics
- Detecting when the last successful communication occurred

The returned tick count represents the absolute system time when the pong was received. Subtract the ping send tick (from [Ping\(\)](#)) to get elapsed ticks, then convert to milliseconds using TICKS\_PER\_SECOND:

```
RTT_ms = ((replyTick - sentTick) * 1000) / TICKS_PER_SECOND
```

##### Note

This function returns the timestamp of the LAST received pong, which may correspond to an earlier ping if multiple pings have been sent.

If no pong has been received since connection establishment, the function may return an error or an initial/invalid timestamp.

This is a non-blocking call that returns immediately with the stored timestamp value.

##### See also

[Ping\(\)](#) to send ping frames and get send timestamps

[WaitForPingReply\(\)](#) for blocking wait on pong reception

## Example Usage

### Expand for Example Usage

#### Examples

##### Calculate Round-Trip Time

```
WebSocket *ws = GetActiveWebSocket();
uint32_t sent_tick;

// Send ping
if (ws->Ping(0, &sent_tick) == 0) {
 // Wait for pong
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 3) == 0) {
 uint32_t reply_tick;

 // Get pong timestamp
 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 // Calculate RTT
 uint32_t rtt_ticks = reply_tick - sent_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 printf("Round-trip time: %.3f ms\n", rtt_ms);
 }
 }
}
```

##### Non-Blocking Pong Check

```
bool CheckForPongReceived(WebSocket *ws, uint32_t ping_sent_tick) {
 uint32_t reply_tick;

 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 // Check if this pong is newer than our ping
 if (reply_tick > ping_sent_tick) {
 uint32_t rtt_ticks = reply_tick - ping_sent_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 printf("Pong received: RTT = %.2f ms\n", rtt_ms);
 return true;
 }
 }

 return false;
}
```

##### Track Last Communication Time

```
uint32_t GetTimeSinceLastPong(WebSocket *ws) {
 uint32_t reply_tick;

 if (ws->GetPingReplyTick(&reply_tick) != 0) {
 printf("No pong received yet\n");
 return 0xFFFFFFFF; // Max value indicates no pong
 }

 uint32_t current_tick = TimeTick;
 uint32_t elapsed_ticks = current_tick - reply_tick;

 // Convert to seconds
 uint32_t elapsed_seconds = elapsed_ticks / TICKS_PER_SECOND;

 return elapsed_seconds;
}

// Usage:
uint32_t idle_time = GetTimeSinceLastPong(ws);
if (idle_time > 60) {
 printf("WARNING: No pong received for %lu seconds\n", idle_time);
}
```

##### Periodic RTT Monitoring

```
void MonitorRTT(WebSocket *ws) {
 static uint32_t last_ping_tick = 0;
 static float rtt_history[10];
 static int rtt_index = 0;

 uint32_t current_tick = TimeTick;

 // Send ping every 5 seconds
 if ((current_tick - last_ping_tick) > (TICKS_PER_SECOND * 5)) {
 uint32_t sent_tick;
```

```

 if (ws->Ping(0, &sent_tick) == 0) {
 last_ping_tick = sent_tick;
 }
 }

 // Check for pong
 uint32_t reply_tick;
 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 if (reply_tick > last_ping_tick) {
 // Calculate and store RTT
 uint32_t rtt_ticks = reply_tick - last_ping_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 rtt_history[rtt_index] = rtt_ms;
 rtt_index = (rtt_index + 1) % 10;

 // Calculate average
 float avg_rtt = 0;
 for (int i = 0; i < 10; i++) {
 avg_rtt += rtt_history[i];
 }
 avg_rtt /= 10.0f;

 printf("RTT: %.2f ms (avg: %.2f ms)\n", rtt_ms, avg_rtt);
 }
 }
}

```

### Detect Slow Responses

```

void DetectSlowConnection(WebSocket *ws, uint32_t ping_sent_tick,
 float threshold_ms) {
 uint32_t reply_tick;

 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 if (reply_tick > ping_sent_tick) {
 uint32_t rtt_ticks = reply_tick - ping_sent_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 if (rtt_ms > threshold_ms) {
 printf("WARNING: Slow connection detected: %.2f ms "
 "(threshold: %.2f ms)\n", rtt_ms, threshold_ms);
 } else {
 printf("Connection speed acceptable: %.2f ms\n", rtt_ms);
 }
 }
 }
}

```

### Log Pong Reception

```

void LogPongReception(WebSocket *ws, const char *label) {
 uint32_t reply_tick;

 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 uint32_t current_time = Secs;

 printf("[%lu] %s: Pong received at tick %lu\n",
 current_time, label, reply_tick);

 // Log to persistent storage
 LogToFile(current_time, label, reply_tick);
 } else {
 printf("%s: No pong data available\n", label);
 }
}

```

### Compare Multiple Ping Attempts

```

void ComparePingAttempts(WebSocket *ws) {
 const int ATTEMPTS = 5;
 uint32_t ping_ticks[ATTEMPTS];
 float rtt[ATTEMPTS];

 for (int i = 0; i < ATTEMPTS; i++) {
 // Send ping
 if (ws->Ping(0, &ping_ticks[i]) == 0) {
 // Wait for pong
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 3) == 0) {
 uint32_t reply_tick;
 ws->GetPingReplyTick(&reply_tick);

 uint32_t rtt = reply_tick - ping_ticks[i];
 rtt[i] = (rtt * 1000.0f) / TICKS_PER_SECOND;
 } else {

```

```

 rtts[i] = -1.0f; // Timeout
 }

 OSTimeDly(TICKS_PER_SECOND);
}

// Analyze results
printf("Ping Attempt Analysis:\n");
for (int i = 0; i < ATTEMPTS; i++) {
 if (rtts[i] >= 0) {
 printf(" Attempt %d: %.2f ms\n", i + 1, rtts[i]);
 } else {
 printf(" Attempt %d: TIMEOUT\n", i + 1);
 }
}
}
}

```

### Validate Pong Sequence

```

bool ValidatePongSequence(WebSocket *ws, uint32_t expected_min_tick) {
 uint32_t reply_tick;

 if (ws->GetPingReplyTick(&reply_tick) != 0) {
 printf("ERROR: No pong data available\n");
 return false;
 }

 if (reply_tick < expected_min_tick) {
 printf("WARNING: Received stale pong (tick %lu < %lu)\n",
 reply_tick, expected_min_tick);
 return false;
 }

 printf("Pong sequence valid (tick %lu)\n", reply_tick);
 return true;
}

```

### 16.190.26.3 GetState()

WS\_State NB::WebSocket::GetState () [inline]

Get the current connection state of the [WebSocket](#).

#### Returns

WS\_State The current state of the [WebSocket](#) connection

This inline function returns the current state of the [WebSocket](#) connection. The state indicates where the connection is in its lifecycle, from initial handshake through active communication to closure.

Common [WebSocket](#) states include:

- WS\_STATE\_CONNECTING: Connection being established, handshake in progress
- WS\_STATE\_OPEN: Connection established and ready for communication
- WS\_STATE\_CLOSING: Close handshake initiated, waiting for closure
- WS\_STATE\_CLOSED: Connection fully closed

Additional states may include:

- WS\_STATE\_INIT: Initial state before connection attempt
- WS\_STATE\_ERROR: [Error](#) state indicating connection failure

Monitoring the state is essential for:

- Determining if the connection is ready for data transmission
- Handling connection lifecycle events appropriately
- Implementing retry logic for failed connections
- Preventing operations on closed connections
- State machine implementations

**Note**

This function is inline for performance efficiency as it's frequently called in connection management code.

The state represents a snapshot at the time of the call and may change immediately afterward due to network events or other operations.

**See also**

[Ping\(\)](#) for checking connection liveness

[WaitForPingReply\(\)](#) for verifying active connection

**Example Usage****Expand for Example Usage****Examples****Check Connection Ready**

```
WebSocket *ws = GetActiveWebSocket();

if (ws->GetState() == WS_STATE_OPEN) {
 // Connection is ready, safe to send data
 ws->write("Hello, WebSocket!", 17);
} else {
 printf("Connection not ready, state: %d\n", ws->GetState());
}
```

**Wait for Connection to Establish**

```
bool WaitForConnection(WebSocket *ws, uint32_t timeout_seconds) {
 uint32_t start_time = Secs;

 while ((Secs - start_time) < timeout_seconds) {
 WS_State state = ws->GetState();

 if (state == WS_STATE_OPEN) {
 printf("Connection established\n");
 return true;
 } else if (state == WS_STATE_CLOSED || state == WS_STATE_ERROR) {
 printf("Connection failed, state: %d\n", state);
 return false;
 }

 // Still connecting, wait a bit
 OSTimeDly(TICKS_PER_SECOND / 10);
 }

 printf("Connection timeout\n");
 return false;
}
```

**State Machine Implementation**

```
void HandleWebSocketState(WebSocket *ws) {
 WS_State state = ws->GetState();

 switch (state) {
 case WS_STATE_INIT:
 printf("Initializing connection...\n");
 break;

 case WS_STATE_CONNECTING:
 printf("Handshake in progress...\n");
 break;

 case WS_STATE_OPEN:
 printf("Connection active\n");
 // Handle data transmission
 HandleActiveConnection(ws);
 break;

 case WS_STATE_CLOSING:
 printf("Connection closing...\n");
 // Cleanup operations
 break;

 case WS_STATE_CLOSED:
 printf("Connection closed\n");
 // Attempt reconnection or cleanup
 break;
 }
}
```

```

 HandleReconnection(ws);
 break;

 case WS_STATE_ERROR:
 printf("Connection error\n");
 HandleConnectionError(ws);
 break;

 default:
 printf("Unknown state: %d\n", state);
 break;
 }
}

```

### Safe Write with State Check

```

int SafeWebSocketWrite(WebSocket *ws, const char *data, int length) {
 WS_State state = ws->GetState();

 if (state != WS_STATE_OPEN) {
 printf("Cannot write: connection not open (state: %d)\n", state);
 return -1;
 }

 return ws->write(data, length);
}

```

### State Transition Monitoring

```

void MonitorWebSocketState(WebSocket *ws) {
 static WS_State last_state = WS_STATE_INIT;

 WS_State current_state = ws->GetState();

 if (current_state != last_state) {
 printf("State transition: %d -> %d\n", last_state, current_state);

 // Log state change
 LogStateChange(Secs, last_state, current_state);

 last_state = current_state;
 }
}

```

### Automatic Reconnection Logic

```

void AutoReconnectTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;

 while (1) {
 WS_State state = ws->GetState();

 if (state == WS_STATE_CLOSED || state == WS_STATE_ERROR) {
 printf("Connection lost, attempting reconnection...\n");

 // Attempt reconnection
 ws->connect("ws://server.com");

 // Wait for connection result
 OSTimeDly(TICKS_PER_SECOND * 5);
 }

 OSTimeDly(TICKS_PER_SECOND);
 }
}

```

### Connection Health Check

```

bool IsConnectionHealthy(WebSocket *ws) {
 WS_State state = ws->GetState();

 if (state == WS_STATE_OPEN) {
 // Connection appears open, verify with ping
 uint32_t sent_tick;
 if (ws->Ping(0, &sent_tick) == 0) {
 return true;
 }
 }

 printf("Connection unhealthy, state: %d\n", state);
 return false;
}

```

### State-based Resource Management

```
void ManageWebSocketResources(WebSocket *ws) {
 WS_State state = ws->GetState();

 switch (state) {
 case WS_STATE_OPEN:
 // Allocate buffers and resources for active connection
 AllocateBuffers(ws);
 break;

 case WS_STATE_CLOSED:
 // Release resources when connection is closed
 ReleaseBuffers(ws);
 break;

 default:
 // Minimal resources for other states
 break;
 }
}
```

---

#### 16.190.26.4 GetWebSocketRecord()

```
static WebSocket * NB::WebSocket::GetWebSocketRecord (
 int fd) [static]
```

Find a [WebSocket](#) record by its file descriptor.

##### Parameters

|           |                                                             |
|-----------|-------------------------------------------------------------|
| <i>fd</i> | The <a href="#">WebSocket</a> file descriptor to search for |
|-----------|-------------------------------------------------------------|

##### Returns

WebSocket\* Pointer to the [WebSocket](#) record if found, nullptr otherwise

This function searches through the internal [WebSocket](#) registry to locate a [WebSocket](#) instance associated with the given file descriptor. It is typically used internally by the [WebSocket](#) management system to retrieve the [WebSocket](#) object for operations on an active connection.

##### Note

This is a static function intended for internal use within the [WebSocket](#) implementation.

##### Example Usage

---

#### Expand for Example Usage

##### Examples

###### Basic Usage

```
// Assuming you have a file descriptor from a WebSocket event
int ws_fd = 5; // Example file descriptor

WebSocket *ws = GetWebSocketRecord(ws_fd);
if (ws != nullptr) {
 // WebSocket found, perform operations
 printf("Found WebSocket for fd %d\n", ws_fd);
} else {
 // WebSocket not found
 printf("No WebSocket found for fd %d\n", ws_fd);
}
```

##### Error Handling

```
int ws_fd = GetWebSocketFdFromEvent(); // Get fd from some event

WebSocket *ws = GetWebSocketRecord(ws_fd);
if (ws == nullptr) {
 printf("ERROR: Invalid WebSocket file descriptor: %d\n", ws_fd);
 return;
}

// Safe to use ws here
ws->SendText("Connection validated");
```

---

### 16.190.26.5 GetWriteSpace()

```
int NB::WebSocket::GetWriteSpace () [inline]
```

Get available transmit buffer space in bytes.

#### Returns

int Number of bytes available in the transmit buffer for writing

This inline function returns the amount of free space currently available in the [WebSocket](#)'s transmit (TX) buffer. The value indicates how many bytes can be written to the buffer before it becomes full.

This function is useful for:

- Determining if there's sufficient space before attempting a write
- Implementing flow control to prevent buffer overflow
- Monitoring buffer utilization and performance
- Deciding whether to queue or drop data in high-throughput scenarios

The available space decreases as data is written to the buffer and increases as buffered data is transmitted over the network. The total buffer capacity is fixed at initialization.

#### Note

This function is inline for performance efficiency, as it's often called in performance-critical paths.

The returned value represents instantaneous available space. It may change immediately after the call as other operations occur.

#### Warning

In multi-threaded environments, the available space may change between checking this value and attempting to write. Always verify write operation return values.

#### See also

[ws\\_write\(\)](#) for writing data to the [WebSocket](#)

[ws\\_flush\(\)](#) to force transmission of buffered data

#### Example Usage

---

### Expand for Example Usage

#### Examples

##### Check Buffer Space Before Writing

```
WebSocket *ws = GetActiveWebSocket();
const char *message = "Important data message";
int msg_length = strlen(message);

int available = ws->GetWriteSpace();
if (available >= msg_length) {
 // Sufficient space, safe to write
 ws_write(ws->GetFd(), message, msg_length);
 printf("Message sent (%d bytes, %d bytes remaining)\n",
 msg_length, available - msg_length);
} else {
 printf("Insufficient buffer space: need %d, have %d\n",
 msg_length, available);
}
```

### Monitor Buffer Utilization

```
void MonitorWebSocketBuffer(WebSocket *ws) {
 int available = ws->GetWriteSpace();
 int total_capacity = GetTxBufferSize(); // Assuming this exists
 int used = total_capacity - available;
 float usage_percent = (used * 100.0f) / total_capacity;

 printf("TX Buffer Status:\n");
 printf(" Used: %d bytes\n", used);
 printf(" Available: %d bytes\n", available);
 printf(" Capacity: %d bytes\n", total_capacity);
 printf(" Usage: %.1f%%\n", usage_percent);

 if (usage_percent > 90.0f) {
 printf(" WARNING: Buffer nearly full!\n");
 }
}
```

### Flow Control Implementation

```
bool WriteWithFlowControl(WebSocket *ws, const char *data, int length) {
 const int MIN_BUFFER_SPACE = 256; // Reserve some space

 int available = ws->GetWriteSpace();

 if (available < MIN_BUFFER_SPACE) {
 // Buffer too full, flush first
 printf("Buffer low (%d bytes), flushing...\n", available);
 ws_flush(ws->GetFd());

 // Wait briefly for buffer to drain
 OSTimeDly(TICKS_PER_SECOND / 10);

 available = ws->GetWriteSpace();
 }

 if (available >= length) {
 ws_write(ws->GetFd(), data, length);
 return true;
 } else {
 printf("ERROR: Still insufficient space after flush\n");
 return false;
 }
}
```

### Large Data Transfer with Space Checking

```
bool SendLargeData(WebSocket *ws, const char *data, int total_length) {
 int bytes_sent = 0;

 while (bytes_sent < total_length) {
 int available = ws->GetWriteSpace();

 if (available < 100) {
 // Low space, flush and wait
 ws_flush(ws->GetFd());
 OSTimeDly(TICKS_PER_SECOND / 20);
 continue;
 }

 // Send as much as we can
 int to_send = (total_length - bytes_sent);
 if (to_send > available) {
 to_send = available;
 }

 int written = ws_write(ws->GetFd(), data + bytes_sent, to_send);
 if (written > 0) {
 bytes_sent += written;
 printf("Sent %d/%d bytes (%d buffer space)\n",
 bytes_sent, total_length, ws->GetWriteSpace());
 } else {
 printf("Write error\n");
 return false;
 }
 }

 ws_flush(ws->GetFd());
 return true;
}
```

## Adaptive Data Rate Control

```
void StreamDataWithAdaptiveRate(WebSocket *ws) {
 const int HIGH_WATER_MARK = 2048;
 const int LOW_WATER_MARK = 512;
 uint32_t delay = TICKS_PER_SECOND / 10; // Start at 100ms

 while (IsStreaming()) {
 char data[256];
 int data_length = GenerateStreamData(data, sizeof(data));

 int available = ws->GetWriteSpace();

 if (available > HIGH_WATER_MARK) {
 // Plenty of space, send faster
 delay = TICKS_PER_SECOND / 20; // 50ms
 } else if (available < LOW_WATER_MARK) {
 // Running low, slow down
 delay = TICKS_PER_SECOND / 5; // 200ms
 ws_flush(ws->GetFd());
 }

 ws_write(ws->GetFd(), data, data_length);
 OSTimeDly(delay);
 }
}
```

## Buffer Health Check

```
typedef enum {
 BUFFER_HEALTHY,
 BUFFER_WARNING,
 BUFFER_CRITICAL
} BufferHealth;

BufferHealth CheckBufferHealth(WebSocket *ws) {
 int available = ws->GetWriteSpace();

 if (available > 1024) {
 return BUFFER_HEALTHY;
 } else if (available > 256) {
 printf("WARNING: Buffer space low (%d bytes)\n", available);
 return BUFFER_WARNING;
 } else {
 printf("CRITICAL: Buffer nearly full (%d bytes left)\n", available);
 return BUFFER_CRITICAL;
 }
}

void HandleBufferHealth(WebSocket *ws) {
 BufferHealth health = CheckBufferHealth(ws);

 switch (health) {
 case BUFFER_HEALTHY:
 // Normal operation
 break;

 case BUFFER_WARNING:
 // Flush to prevent congestion
 ws_flush(ws->GetFd());
 break;

 case BUFFER_CRITICAL:
 // Emergency flush and delay
 ws_flush(ws->GetFd());
 OSTimeDly(TICKS_PER_SECOND / 4);
 break;
 }
}
```

## Prioritized Message Sending

```
typedef enum {
 MSG_PRIORITY_HIGH,
 MSG_PRIORITY_NORMAL,
 MSG_PRIORITY_LOW
} MessagePriority;

bool SendPrioritizedMessage(WebSocket *ws, const char *msg,
 int length, MessagePriority priority) {
 int available = ws->GetWriteSpace();

 // High priority messages get special treatment
 if (priority == MSG_PRIORITY_HIGH) {
 if (available < length) {
 // Force flush for high priority

```

```

 ws_flush(ws->GetFd());
 OSTimeDly(TICKS_PER_SECOND / 10);
 available = ws->GetWriteSpace();
 }

 // Send even if space is tight
 ws_write(ws->GetFd(), msg, length);
 ws_flush(ws->GetFd());
 return true;
}

// Normal/low priority - only send if space available
if (available >= length) {
 ws_write(ws->GetFd(), msg, length);
 return true;
}

printf("Dropped %s priority message (insufficient space)\n",
 priority == MSG_PRIORITY_NORMAL ? "normal" : "low");
return false;
}

```

### Diagnostic Logging

```

void LogWebSocketBufferState(WebSocket *ws, const char *context) {
 int available = ws->GetWriteSpace();
 uint32_t timestamp = Secs;

 printf("[%lu] %s: TX buffer = %d bytes available\n",
 timestamp, context, available);

 // Log to persistent storage or diagnostics system
 LogToFile(timestamp, context, available);
}

// Usage examples:
LogWebSocketBufferState(ws, "Before large transfer");
SendLargeData(ws, data, data_size);
LogWebSocketBufferState(ws, "After large transfer");

```

### 16.190.26.6 Ping()

```

int NB::WebSocket::Ping (
 uint32_t len,
 uint32_t * sentTick)

```

Send a [WebSocket](#) ping frame and record the timestamp.

#### Parameters

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <i>len</i>      | Length of optional ping payload data (typically 0 for standard ping) |
| <i>sentTick</i> | Pointer to variable to receive the tick count when ping was sent     |

#### Returns

int Returns 0 on success, negative value on failure

This function sends a [WebSocket](#) ping control frame to the peer and records the system tick count at the time of transmission. Ping frames are used to:

- Verify the connection is still alive (keepalive mechanism)
- Measure round-trip time (RTT) when paired with [WaitForPingReply\(\)](#)
- Detect network issues or dead connections
- Prevent idle connection timeouts

The ping frame may optionally include payload data (up to 125 bytes per [WebSocket](#) specification), though a zero-length ping is most common. The peer should respond with a pong frame containing the same payload.

The sentTick parameter receives the system tick count (from TimeTick) at the moment the ping was sent. This timestamp can be used to calculate round-trip time when the corresponding pong is received.

**Note**

Ping frames are control frames and have priority over data frames in the [WebSocket](#) protocol.  
According to RFC 6455, the peer must respond to a ping with a pong frame containing identical payload data.

**Warning**

Sending too many pings in rapid succession may be considered abusive by the peer and could result in connection closure.

**See also**

[WaitForPingReply\(\)](#) to wait for the corresponding pong response

[GetPingReplyTick\(\)](#) to retrieve the pong receive timestamp

**Example Usage****Expand for Example Usage****Examples****Basic Ping**

```
WebSocket *ws = GetActiveWebSocket();
uint32_t sent_tick;

// Send a ping with no payload
if (ws->Ping(0, &sent_tick) == 0) {
 printf("Ping sent at tick %lu\n", sent_tick);
} else {
 printf("Failed to send ping\n");
}
```

**Measure Round-Trip Time**

```
float MeasureRoundTripTime(WebSocket *ws) {
 uint32_t sent_tick;

 // Send ping
 if (ws->Ping(0, &sent_tick) != 0) {
 printf("Failed to send ping\n");
 return -1.0f;
 }

 // Wait for pong (with 5 second timeout)
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 5) == 0) {
 uint32_t reply_tick;
 ws->GetPingReplyTick(&reply_tick);

 // Calculate RTT in milliseconds
 uint32_t rtt_ticks = reply_tick - sent_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 printf("Round-trip time: %.2f ms\n", rtt_ms);
 return rtt_ms;
 } else {
 printf("Ping timeout - no pong received\n");
 return -1.0f;
 }
}
```

**Periodic Keepalive**

```
void KeepaliveTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;
 uint32_t sent_tick;

 while (1) {
 if (ws->GetState() == WS_STATE_OPEN) {
 // Send keepalive ping every 30 seconds
 if (ws->Ping(0, &sent_tick) == 0) {
 printf("Keepalive ping sent\n");
 } else {
 printf("WARNING: Keepalive ping failed\n");
 }
 }

 OSTimeDly(TICKS_PER_SECOND * 30);
 }
}
```

### Connection Health Check

```
bool VerifyConnectionAlive(WebSocket *ws) {
 uint32_t sent_tick;

 printf("Verifying connection health...\n");

 // Send ping
 if (ws->Ping(0, &sent_tick) != 0) {
 printf("ERROR: Cannot send ping\n");
 return false;
 }

 // Wait for response (3 second timeout)
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 3) == 0) {
 printf("Connection verified: peer responsive\n");
 return true;
 } else {
 printf("ERROR: Connection appears dead (no pong)\n");
 return false;
 }
}
```

### Multiple Ping Attempts

```
bool PingWithRetry(WebSocket *ws, int max_attempts) {
 for (int i = 0; i < max_attempts; i++) {
 uint32_t sent_tick;

 printf("Ping attempt %d/%d\n", i + 1, max_attempts);

 if (ws->Ping(0, &sent_tick) == 0) {
 // Wait for pong
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 2) == 0) {
 printf("Pong received on attempt %d\n", i + 1);
 return true;
 }
 }

 // Brief delay before retry
 OSTimeDly(TICKS_PER_SECOND / 2);
 }

 printf("All ping attempts failed\n");
 return false;
}
```

### Network Quality Monitoring

```
void MonitorNetworkQuality(WebSocket *ws) {
 const int SAMPLE_COUNT = 10;
 float rtt_samples[SAMPLE_COUNT];
 int successful_pings = 0;

 printf("Monitoring network quality (%d samples)...\n", SAMPLE_COUNT);

 for (int i = 0; i < SAMPLE_COUNT; i++) {
 uint32_t sent_tick;

 if (ws->Ping(0, &sent_tick) == 0) {
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 2) == 0) {
 uint32_t reply_tick;
 ws->GetPingReplyTick(&reply_tick);

 uint32_t rtt_ticks = reply_tick - sent_tick;
 rtt_samples[successful_pings] =
 (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;
 successful_pings++;
 }
 }

 OSTimeDly(TICKS_PER_SECOND);
 }

 if (successful_pings > 0) {
 // Calculate statistics
 float avg = 0, min = rtt_samples[0], max = rtt_samples[0];
 for (int i = 0; i < successful_pings; i++) {
 avg += rtt_samples[i];
 if (rtt_samples[i] < min) min = rtt_samples[i];
 if (rtt_samples[i] > max) max = rtt_samples[i];
 }
 avg /= successful_pings;

 printf("Network Quality Report:\n");
 printf(" Success rate: %d/%d (%.1f%%)\n",
 successful_pings, SAMPLE_COUNT, (float)successful_pings / SAMPLE_COUNT);
 }
}
```

```

 successful_pings, SAMPLE_COUNT,
 (successful_pings * 100.0f) / SAMPLE_COUNT);
 printf(" RTT: avg=%.2fms, min=%.2fms, max=%.2fms\n",
 avg, min, max);
} else {
 printf("ERROR: No successful pings\n");
}
}

```

### Ping with Payload

```

bool SendPingWithData(WebSocket *ws, const char *payload, uint32_t len) {
 uint32_t sent_tick;

 if (len > 125) {
 printf("ERROR: Ping payload too large (max 125 bytes)\n");
 return false;
 }

 // Send ping with custom payload
 if (ws->Ping(len, &sent_tick) == 0) {
 printf("Ping with %lu byte payload sent\n", len);
 return true;
 } else {
 printf("Failed to send ping\n");
 return false;
 }
}

```

### 16.190.26.7 Pong()

```

void NB::WebSocket::Pong (
 uint32_t len)

```

Send a pong frame in response to a ping.

#### Parameters

|            |                                                                    |
|------------|--------------------------------------------------------------------|
| <i>len</i> | Length of pong payload data (should match the ping payload length) |
|------------|--------------------------------------------------------------------|

This member function sends a [WebSocket](#) pong control frame, typically in response to a received ping frame from the peer. According to the [WebSocket](#) protocol (RFC 6455), when a ping is received, the endpoint must respond with a pong containing the same payload data.

Pong frames serve multiple purposes:

- Acknowledge receipt of ping frames (keepalive confirmation)
- Enable the peer to measure round-trip time
- Demonstrate connection liveness
- Satisfy protocol requirements for ping-pong exchanges

The [WebSocket](#) implementation typically handles ping frames automatically and sends pong responses without application intervention. However, this function allows manual pong transmission if needed for:

- Custom ping-pong protocols
- Testing and debugging
- Explicit control over pong timing
- Unsolicited pongs (though not recommended by the spec)

The length parameter should match the payload length of the ping being responded to. Most pings have zero-length payloads, so len=0 is most common. The maximum payload length for control frames is 125 bytes per the [WebSocket](#) specification.

**Note**

In most cases, the [WebSocket](#) implementation automatically handles incoming pings and sends pongs without requiring application code to call this function.

Pong frames are control frames and have priority over data frames in the [WebSocket](#) protocol.

Per RFC 6455, pong frames may be sent unsolicited, though this is uncommon and not recommended unless you have a specific reason.

**Warning**

The payload data must match the ping payload. This function sends a pong with the specified length, but the actual payload matching is handled internally by the [WebSocket](#) implementation.

**See also**

[Ping\(\)](#) to send ping frames

[WaitForPingReply\(\)](#) to wait for pong responses to sent pings

[GetPingReplyTick\(\)](#) to retrieve pong reception timestamp

**Example Usage****Expand for Example Usage****Examples****Manual Pong Response**

```
WebSocket *ws = GetActiveWebSocket();

// Send pong with no payload (most common case)
ws->Pong(0);
printf("Pong frame sent\n");
```

**Custom Ping Handler**

```
void HandlePingFrame(WebSocket *ws, uint32_t payload_length) {
 printf("Received ping with %lu byte payload\n", payload_length);

 // Send matching pong
 ws->Pong(payload_length);

 printf("Pong response sent\n");
}
```

**Delayed Pong for Testing**

```
void SendDelayedPong(WebSocket *ws, uint32_t delay_ms) {
 printf("Delaying pong by %lu ms...\n", delay_ms);

 // Simulate processing delay
 OSTimeDly((delay_ms * TICKS_PER_SECOND) / 1000);

 // Send pong
 ws->Pong(0);

 printf("Delayed pong sent\n");
}
```

**Pong with Payload**

```
void SendPongWithPayload(WebSocket *ws, const char *payload, uint32_t len) {
 if (len > 125) {
 printf("ERROR: Pong payload too large (max 125 bytes)\n");
 return;
 }

 // Note: This example assumes the WebSocket implementation
 // has been configured with the payload data to echo
 ws->Pong(len);

 printf("Pong sent with %lu byte payload\n", len);
}
```

### Monitored Pong Response

```
void MonitoredPongResponse(WebSocket *ws, uint32_t ping_received_tick) {
 uint32_t current_tick = TimeTick;
 uint32_t processing_time = current_tick - ping_received_tick;

 // Send pong
 ws->Pong(0);

 float processing_ms = (processing_time * 1000.0f) / TICKS_PER_SECOND;
 printf("Pong sent (processing time: %.3f ms)\n", processing_ms);
}
```

### Conditional Pong Sending

```
void ConditionalPong(WebSocket *ws, bool should_respond) {
 if (should_respond) {
 ws->Pong(0);
 printf("Pong sent in response to ping\n");
 } else {
 printf("Pong suppressed (testing mode)\n");
 }
}
```

### Unsolicited Pong (Heartbeat)

```
void SendUnsolicitedPong(WebSocket *ws) {
 // Per RFC 6455, unsolicited pongs are allowed
 // (though uncommon in practice)
 ws->Pong(0);

 printf("Unsolicited pong sent as heartbeat\n");
}

void HeartbeatTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;

 while (1) {
 if (ws->GetState() == WS_STATE_OPEN) {
 SendUnsolicitedPong(ws);
 }

 // Send heartbeat every 30 seconds
 OSTimeDly(TICKS_PER_SECOND * 30);
 }
}
```

### Pong Statistics Tracking

```
static uint32_t pong_count = 0;

void SendTrackedPong(WebSocket *ws) {
 ws->Pong(0);
 pong_count++;

 printf("Pong sent (total: %lu)\n", pong_count);

 // Log every 100 pongs
 if (pong_count % 100 == 0) {
 printf("Milestone: %lu pongs sent\n", pong_count);
 }
}
```

### State-Aware Pong Handling

```
void SafePongResponse(WebSocket *ws) {
 WS_State state = ws->GetState();

 if (state == WS_STATE_OPEN) {
 ws->Pong(0);
 printf("Pong sent (connection open)\n");
 } else {
 printf("Cannot send pong: connection not open (state: %d)\n", state);
 }
}
```

### Diagnostic Pong with Logging

```
void DiagnosticPong(WebSocket *ws, const char *context) {
 uint32_t timestamp = Secs;
 uint32_t send_tick = TimeTick;

 // Send pong
 ws->Pong(0);

 // Log the event
 printf("[%lu] Pong sent in context: %s (tick: %lu)\n",
 timestamp, context, send_tick);

 // Could also log to persistent storage
 LogEvent(timestamp, "PONG_SENT", context, send_tick);
}
```

### Automatic Ping-Pong Handler

```
// Note: This is typically handled automatically by the WebSocket library
// This example shows what happens internally
void OnPingReceived(WebSocket *ws, const uint8_t *payload, uint32_t len) {
 printf("Ping received with %lu byte payload\n", len);

 // Store payload for echo in pong (done internally)
 // SetPongPayload(payload, len);

 // Send pong with matching length
 ws->Pong(len);

 printf("Automatic pong response sent\n");
}
```

### Throttled Pong Responses

```
void ThrottledPong(WebSocket *ws) {
 static uint32_t last_pong_tick = 0;
 const uint32_t MIN_PONG_INTERVAL = TICKS_PER_SECOND / 10; // 100ms

 uint32_t current_tick = TimeTick;

 if ((current_tick - last_pong_tick) >= MIN_PONG_INTERVAL) {
 ws->Pong(0);
 last_pong_tick = current_tick;
 printf("Pong sent\n");
 } else {
 printf("Pong throttled (too soon after last pong)\n");
 }
}
```

#### 16.190.26.8 promote\_tcp\_ws()

```
static int NB::WebSocket::promote_tcp_ws (
 int tcp_fd) [static]
```

Promote a TCP socket to a [WebSocket](#) connection after successful handshake.

#### Parameters

|                           |                                           |
|---------------------------|-------------------------------------------|
| <code>tcp↔<br/>_fd</code> | The TCP socket file descriptor to promote |
|---------------------------|-------------------------------------------|

#### Returns

int Returns 0 on success, negative value on failure

This function converts an existing TCP connection into a [WebSocket](#) connection after the [WebSocket](#) handshake has been completed. It performs the necessary protocol upgrade and registers the connection in the [WebSocket](#) management system.

The promotion process typically involves:

- Validating the [WebSocket](#) handshake headers
- Switching the socket protocol from HTTP to [WebSocket](#)
- Registering the new [WebSocket](#) connection

- Configuring appropriate callbacks for [WebSocket](#) events

#### Note

This function should only be called after a successful [WebSocket](#) handshake. Calling it on an invalid or non-handshaked connection will fail.

#### Warning

The original TCP socket should not be used directly after promotion. All further communication must use [WebSocket](#) APIs.

#### Example Usage

---

### Expand for Example Usage

#### Examples

##### Basic Promotion

```
// After receiving WebSocket handshake on TCP connection
int tcp_fd = AcceptTcpConnection(); // Accept incoming TCP connection

// ... validate WebSocket handshake headers ...

// Promote TCP socket to WebSocket
int result = promote_tcp_ws(tcp_fd);
if (result == 0) {
 printf("Successfully promoted TCP socket %d to WebSocket\n", tcp_fd);
} else {
 printf("Failed to promote socket %d, error: %d\n", tcp_fd, result);
 close(tcp_fd);
}
```

##### HTTP Upgrade Handler

```
void HandleWebSocketUpgrade(int tcp_fd, HTTP_Request &request) {
 // Verify this is a WebSocket upgrade request
 if (request.GetHeader("Upgrade") != "websocket") {
 SendHttpRequest(tcp_fd, 400, "Bad Request");
 return;
 }

 // Send handshake response
 SendWebSocketHandshakeResponse(tcp_fd, request);

 // Promote to WebSocket
 if (promote_tcp_ws(tcp_fd) == 0) {
 printf("WebSocket connection established\n");
 // WebSocket is now ready for use
 } else {
 printf("ERROR: Failed to promote connection\n");
 close(tcp_fd);
 }
}
```

##### Complete Server Example

```
void WebSocketServerTask(void *pd) {
 int listen_fd = CreateTcpListenSocket(8080);

 while (1) {
 int tcp_fd = accept(listen_fd, nullptr, nullptr);

 if (tcp_fd > 0) {
 // Read HTTP upgrade request
 if (ValidateWebSocketHandshake(tcp_fd)) {
 // Handshake valid, promote to WebSocket
 if (promote_tcp_ws(tcp_fd) == 0) {
 printf("New WebSocket client connected\n");
 // Connection now managed by WebSocket system
 } else {
 printf("Failed to create WebSocket\n");
 close(tcp_fd);
 }
 } else {
 // Not a valid WebSocket request
 SendHttpRequest(tcp_fd, 400);
 close(tcp_fd);
 }
 }
 }
}
```

```
 }
 OSTimeDly(TICKS_PER_SECOND / 10);
}
}
```

### 16.190.26.9 ReadData()

```
int NB::WebSocket::ReadData (
 char * buf,
 int nbytes)
```

Read data from the [WebSocket](#) connection.

#### Parameters

|               |                                                      |
|---------------|------------------------------------------------------|
| <i>buf</i>    | Pointer to buffer where received data will be stored |
| <i>nbytes</i> | Maximum number of bytes to read into the buffer      |

#### Returns

int Number of bytes actually read on success, 0 if no data available, negative value on error or connection closed

This member function reads data from the [WebSocket](#) connection into the provided buffer. It handles [WebSocket](#) frame decoding automatically, presenting the application data to the caller without protocol overhead.

Key characteristics:

- Automatic [WebSocket](#) frame parsing and payload extraction
- Handles fragmented messages transparently
- Processes control frames (ping, pong, close) internally
- Non-blocking operation when no data is available
- Removes [WebSocket](#) framing and masking

The function operates in non-blocking mode:

- Returns immediately with available data
- Returns 0 if no data is currently available
- Returns negative value on error or connection closure

Return value interpretation:

- Positive value: Number of bytes read successfully
- Zero: No data currently available (not an error)
- Negative: [Error](#) occurred or connection closed

#### Note

The buffer must be large enough to hold the requested number of bytes. Reading less than the available data will leave remaining data for subsequent reads.

This function performs non-blocking reads. For blocking reads with timeout, use `ReadDataWithTimeout()` or similar if available.

Control frames (ping, pong, close) are typically handled automatically and not returned to the application.

## Warning

Always check the return value. A return of 0 or negative indicates no data was read, which requires different handling than successful reads.

The buffer pointer must remain valid and the buffer must be large enough to hold nbytes.

## See also

[WriteData\(\)](#) for sending data over the [WebSocket](#)

[GetState\(\)](#) to check connection state before reading

## Example Usage

### Expand for Example Usage

#### Examples Basic Read

```
WebSocket *ws = GetActiveWebSocket();
char buffer[512];

int bytes_read = ws->ReadData(buffer, sizeof(buffer) - 1);
if (bytes_read > 0) {
 buffer[bytes_read] = '\0'; // Null terminate for string operations
 printf("Received %d bytes: %s\n", bytes_read, buffer);
} else if (bytes_read == 0) {
 printf("No data available\n");
} else {
 printf("Error reading data\n");
}
```

#### Read with Error Handling

```
int SafeRead(WebSocket *ws, char *buffer, int buffer_size) {
 if (buffer == nullptr || buffer_size <= 0) {
 printf("ERROR: Invalid buffer parameters\n");
 return -1;
 }

 if (ws->GetState() != WS_STATE_OPEN) {
 printf("ERROR: Connection not open\n");
 return -1;
 }

 int bytes_read = ws->ReadData(buffer, buffer_size - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 return bytes_read;
 } else if (bytes_read == 0) {
 // No data available, not an error
 return 0;
 } else {
 // Connection error or closed
 printf("Read error, closing connection\n");
 return -1;
 }
}
```

#### Continuous Reading Loop

```
void ReadTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;
 char buffer[1024];

 while (1) {
 int bytes_read = ws->ReadData(buffer, sizeof(buffer) - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 printf("Received: %s\n", buffer);

 // Process the received data
 ProcessMessage(buffer, bytes_read);
 } else if (bytes_read < 0) {
 printf("Connection error or closed\n");
 break;
 }
 }
}
```

```

 }

 // Brief delay to prevent CPU spinning
 OSTimeDly(TICKS_PER_SECOND / 100);
}

printf("Read task exiting\n");
}

```

### JSON Message Reading

```

bool ReadJsonMessage(WebSocket *ws, char *json_buffer, int buffer_size) {
 int bytes_read = ws->ReadData(json_buffer, buffer_size - 1);

 if (bytes_read > 0) {
 json_buffer[bytes_read] = '\0';

 // Validate it's JSON
 if (json_buffer[0] == '{' || json_buffer[0] == '[') {
 printf("Received JSON: %s\n", json_buffer);
 return true;
 } else {
 printf("WARNING: Non-JSON data received\n");
 return false;
 }
 }

 return false;
}

```

### Binary Data Reading

```

int ReadBinaryFrame(WebSocket *ws, uint8_t *data_buffer, int max_size) {
 int bytes_read = ws->ReadData((char *)data_buffer, max_size);

 if (bytes_read > 0) {
 printf("Received %d bytes of binary data:\n", bytes_read);

 // Display as hex
 for (int i = 0; i < bytes_read; i++) {
 printf("%02X ", data_buffer[i]);
 if ((i + 1) % 16 == 0) printf("\n");
 }
 printf("\n");
 }

 return bytes_read;
}

```

### Multi-Buffer Reading (Large Messages)

```

void ReadLargeMessage(WebSocket *ws) {
 const int CHUNK_SIZE = 256;
 char chunk[CHUNK_SIZE];
 int total_bytes = 0;

 printf("Reading large message in chunks...\n");

 while (1) {
 int bytes_read = ws->ReadData(chunk, CHUNK_SIZE - 1);

 if (bytes_read > 0) {
 chunk[bytes_read] = '\0';
 total_bytes += bytes_read;

 // Process this chunk
 ProcessChunk(chunk, bytes_read);
 } else if (bytes_read == 0) {
 // No more data available
 break;
 } else {
 printf("ERROR: Read failed\n");
 break;
 }
 }

 printf("Total bytes read: %d\n", total_bytes);
}

```

### Read with Manual Timeout

```
int ReadWithTimeout(WebSocket *ws, char *buffer, int buffer_size,
 uint32_t timeout_ms) {
 uint32_t start_tick = TimeTick;
 uint32_t timeout_ticks = (timeout_ms * TICKS_PER_SECOND) / 1000;

 while (1) {
 int bytes_read = ws->ReadData(buffer, buffer_size - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 return bytes_read;
 } else if (bytes_read < 0) {
 // Error
 return -1;
 }

 // Check timeout
 if ((TimeTick - start_tick) > timeout_ticks) {
 printf("Read timeout after %lu ms\n", timeout_ms);
 return 0; // Timeout
 }

 OSTimeDly(TICKS_PER_SECOND / 100);
 }
}
```

### Command Processing Pattern

```
void ProcessCommands(WebSocket *ws) {
 char command[256];

 while (1) {
 int bytes_read = ws->ReadData(command, sizeof(command) - 1);

 if (bytes_read > 0) {
 command[bytes_read] = '\0';

 // Process command and generate response
 char response[256];
 HandleCommand(command, response, sizeof(response));

 // Send response
 ws->WriteData(response, strlen(response));
 ws->Flush();

 } else if (bytes_read < 0) {
 break;
 }

 OSTimeDly(TICKS_PER_SECOND / 50);
 }
}
```

### Echo Server Implementation

```
void EchoServerTask(WebSocket *ws) {
 char buffer[512];

 printf("Echo server started\n");

 while (1) {
 int bytes_read = ws->ReadData(buffer, sizeof(buffer) - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 printf("Echo: %s\n", buffer);

 // Echo back
 int bytes_written = ws->WriteData(buffer, bytes_read);
 if (bytes_written > 0) {
 ws->Flush();
 }

 } else if (bytes_read < 0) {
 printf("Connection closed\n");
 break;
 }

 OSTimeDly(TICKS_PER_SECOND / 100);
 }
}
```

### Message Queue Implementation

```
#define MAX_MESSAGES 10

typedef struct {
 char data[256];
 int length;
} Message;

Message message_queue[MAX_MESSAGES];
int queue_head = 0;
int queue_tail = 0;

void ReadToQueue(WebSocket *ws) {
 char buffer[256];

 int bytes_read = ws->ReadData(buffer, sizeof(buffer) - 1);

 if (bytes_read > 0) {
 // Add to queue if space available
 int next_tail = (queue_tail + 1) % MAX_MESSAGES;

 if (next_tail != queue_head) {
 memcpy(message_queue[queue_tail].data, buffer, bytes_read);
 message_queue[queue_tail].length = bytes_read;
 queue_tail = next_tail;

 printf("Message queued (%d in queue)\n",
 (queue_tail - queue_head + MAX_MESSAGES) % MAX_MESSAGES);
 } else {
 printf("WARNING: Message queue full, dropping message\n");
 }
 }
}
```

### Statistical Monitoring

```
void MonitorReadStatistics(WebSocket *ws) {
 static uint32_t total_bytes = 0;
 static uint32_t message_count = 0;
 static uint32_t start_time = 0;

 if (start_time == 0) {
 start_time = Secs;
 }

 char buffer[1024];
 int bytes_read = ws->ReadData(buffer, sizeof(buffer) - 1);

 if (bytes_read > 0) {
 total_bytes += bytes_read;
 message_count++;

 uint32_t elapsed = Secs - start_time;
 if (elapsed > 0) {
 float bytes_per_sec = total_bytes / (float)elapsed;
 float msgs_per_sec = message_count / (float)elapsed;

 printf("Stats: %lu bytes (%lu msgs) in %lu sec "
 "(%.1f B/s, %.1f msg/s)\n",
 total_bytes, message_count, elapsed,
 bytes_per_sec, msgs_per_sec);
 }
 }
}
```

#### 16.190.26.10 RunSkippedCallback()

```
static void NB::WebSocket::RunSkippedCallback () [static]
```

Executes the callback function when a scheduled run is skipped.

### 16.190.27 Description

This static function is invoked when a scheduled task or operation cannot be executed at its intended time (e.g., due to system overload, timing conflicts, or the previous execution still running). It allows the system to handle skip events gracefully by notifying registered handlers.

### 16.190.28 Usage Notes

- This is a static member function and does not require an object instance

- Typically called internally by the scheduler when a run is skipped
- Should be lightweight to avoid further timing issues
- May log skip events or increment skip counters for monitoring

### 16.190.29 Thread Safety

Implementation should be thread-safe if called from multiple scheduler contexts.

### 16.190.30 See Also

- Related scheduling functions
- Skip event handling documentation

---

### Expand for Example Usage

#### Examples

##### Example 1: Basic Skip Callback Registration

```
// In your scheduler class
class TaskScheduler {
private:
 static void RunSkippedCallBack() {
 printf("Task execution was skipped\r\n");
 }

public:
 void RegisterSkipHandler() {
 // Register the callback with scheduler
 SetSkipCallback(RunSkippedCallBack);
 }
};
```

##### Example 2: Skip Tracking Implementation

```
class PeriodicTask {
private:
 static uint32_t skipCount;

 static void RunSkippedCallBack() {
 skipCount++;
 printf("Task skipped (total: %lu)\r\n", skipCount);

 // Log if skip count is high
 if (skipCount > 10) {
 printf("WARNING: High skip count detected\r\n");
 }
 }

public:
 static uint32_t GetSkipCount() { return skipCount; }
};

uint32_t PeriodicTask::skipCount = 0;
```

##### Example 3: Detailed Skip Event Handling

```
class MonitoredTask {
private:
 static void RunSkippedCallBack() {
 uint32_t currentTime = Secs;

 // Log skip event with timestamp
 printf("[%lu] Task execution skipped\r\n", currentTime);

 // Record in event log
 LogEvent("TASK_SKIP", currentTime);

 // Optionally trigger recovery action
 if (GetSystemLoad() < 50) {
 printf("System load normal, attempting retry\r\n");
 ScheduleRetry();
 }
 }
};
```

---

### 16.190.30.1 setoption()

```
int NB::WebSocket::setoption (
 int option)
```

Set a socket option on this [WebSocket](#) connection.

#### Parameters

|               |                                                                                      |
|---------------|--------------------------------------------------------------------------------------|
| <i>option</i> | The socket option to set (e.g., WS_SO_TEXT, WS_SO_BINARY, SO_KEEPALIVE, TCP_NODELAY) |
|---------------|--------------------------------------------------------------------------------------|

#### Returns

int Returns 0 on success, negative value on failure

This member function sets a specific socket option on the [WebSocket](#) connection. Options control various aspects of the [WebSocket](#) behavior and the underlying TCP socket configuration.

Common WebSocket-specific options:

- WS\_SO\_TEXT: Treat data as text frames (default)
- WS\_SO\_BINARY: Treat data as binary frames
- WS\_SO\_COMPRESS: Enable per-message compression (if supported)

Common TCP socket options:

- SO\_KEEPALIVE: Enable TCP keepalive packets
- TCP\_NODELAY: Disable Nagle's algorithm for low-latency
- SO\_REUSEADDR: Allow address reuse
- SO\_SNDBUF/SO\_RCVBUF: Adjust send/receive buffer sizes

Options can be combined using bitwise OR to set multiple options simultaneously. Setting an already-set option has no adverse effect.

#### Note

Options should be set before or shortly after connection establishment for best results. Some options may not take effect if changed mid-connection.

#### Warning

Setting incompatible options (e.g., both WS\_SO\_TEXT and WS\_SO\_BINARY) may result in undefined behavior. The last option set typically takes precedence.

#### See also

[cloption\(\)](#) for clearing socket options

[getoption\(\)](#) for querying current option state

#### Example Usage

---

### Expand for Example Usage

#### Examples

### Set Binary Mode

```
WebSocket *ws = new WebSocket("ws://example.com");

// Enable binary frame mode for sending binary data
if (ws->setoption(WS_SO_BINARY) == 0) {
 printf("Binary mode enabled\n");

 // Now send binary data
 uint8_t data[] = {0x01, 0x02, 0x03, 0x04};
 ws->write((char *)data, sizeof(data));
} else {
 printf("Failed to enable binary mode\n");
}
```

### Enable TCP Keepalive

```
WebSocket *ws = GetActiveWebSocket();

// Enable keepalive to detect dead connections
if (ws->setoption(SO_KEEPALIVE) == 0) {
 printf("TCP keepalive enabled\n");
} else {
 printf("Failed to enable keepalive\n");
}
```

### Configure for Low Latency

```
void ConfigureLowLatencyWebSocket(WebSocket *ws) {
 // Disable Nagle's algorithm for immediate packet transmission
 if (ws->setoption(TCP_NODELAY) == 0) {
 printf("Low latency mode enabled\n");
 } else {
 printf("WARNING: Could not enable TCP_NODELAY\n");
 }
}
```

### Set Multiple Options

```
WebSocket *ws = new WebSocket("ws://realtime-server.com");

// Configure for real-time binary streaming
int result = 0;

// Set binary mode
result |= ws->setoption(WS_SO_BINARY);

// Enable low latency
result |= ws->setoption(TCP_NODELAY);

// Enable keepalive
result |= ws->setoption(SO_KEEPALIVE);

if (result == 0) {
 printf("All options set successfully\n");
} else {
 printf("WARNING: Some options failed to set\n");
}
```

### Switch Between Text and Binary Modes

```
void SwitchToBinaryMode(WebSocket *ws) {
 // Clear text mode if set
 ws->cloption(WS_SO_TEXT);

 // Set binary mode
 if (ws->setoption(WS_SO_BINARY) == 0) {
 printf("Switched to binary mode\n");
 }
}

void SwitchToTextMode(WebSocket *ws) {
 // Clear binary mode if set
 ws->cloption(WS_SO_BINARY);

 // Set text mode
 if (ws->setoption(WS_SO_TEXT) == 0) {
 printf("Switched to text mode\n");
 }
}
```

### Conditional Option Setting

```
void ConfigureWebSocketForDataType(WebSocket *ws, bool is_binary) {
 if (is_binary) {
 ws->setoption(WS_SO_BINARY);
 printf("Configured for binary data\n");
 } else {
 ws->setoption(WS_SO_TEXT);
 printf("Configured for text data\n");
 }
}
```

### Production vs Development Configuration

```
void ConfigureWebSocket(WebSocket *ws, bool production_mode) {
 if (production_mode) {
 // Production: optimize for reliability
 ws->setoption(SO_KEEPALIVE);
 printf("Production configuration applied\n");
 } else {
 // Development: optimize for debugging
 ws->setoption(TCP_NODELAY);
 printf("Development configuration applied\n");
 }
}
```

### Enable Compression (if supported)

```
WebSocket *ws = new WebSocket("ws://example.com");

// Try to enable per-message compression
if (ws->setoption(WS_SO_COMPRESS) == 0) {
 printf("Compression enabled - reduced bandwidth usage\n");
} else {
 printf("Compression not available or not supported\n");
}
```

#### 16.190.30.2 WaitForPingReply()

```
int NB::WebSocket::WaitForPingReply (
 uint32_t timeout)
```

Block waiting for a pong reply to a previously sent ping.

#### Parameters

|                |                                                                     |
|----------------|---------------------------------------------------------------------|
| <i>timeout</i> | Timeout value in system ticks (use TICKS_PER_SECOND for conversion) |
|----------------|---------------------------------------------------------------------|

#### Returns

int Returns 0 if pong received within timeout, negative value on timeout or error

This function blocks the calling task until a pong frame is received in response to a previously sent ping, or until the specified timeout expires. It is typically called immediately after [Ping\(\)](#) to wait for the peer's response.

The function is useful for:

- Measuring round-trip time with known timeout bounds
- Verifying connection responsiveness
- Implementing synchronous ping-pong interactions
- Detecting dead or slow connections

The timeout parameter is specified in system ticks. Use TICKS\_PER\_SECOND to convert from seconds:

- 1 second: TICKS\_PER\_SECOND
- 5 seconds: TICKS\_PER\_SECOND \* 5
- 500 ms: TICKS\_PER\_SECOND / 2

Return value interpretation:

- 0: Pong received successfully within timeout
- Negative: Timeout expired or error occurred

**Note**

This function blocks the calling task. Ensure the timeout is appropriate for your application to avoid excessive blocking.

A pong should typically be received within a few hundred milliseconds on a healthy network. Timeouts of 2-5 seconds are common.

**Warning**

Do not call this function without first calling [Ping\(\)](#). The behavior is undefined if no ping has been sent.

Very long timeouts may make the application appear unresponsive.

**See also**

[Ping\(\)](#) to send the ping frame that this function waits for

[GetPingReplyTick\(\)](#) to retrieve the exact pong receive timestamp

**Example Usage****Expand for Example Usage****Examples****Basic Ping-Pong Sequence**

```
WebSocket *ws = GetActiveWebSocket();
uint32_t sent_tick;

// Send ping
if (ws->Ping(0, &sent_tick) == 0) {
 printf("Ping sent, waiting for pong...\n");

 // Wait up to 3 seconds for pong
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 3) == 0) {
 printf("Pong received!\n");
 } else {
 printf("Timeout: No pong received\n");
 }
}
```

**Measure Exact Round-Trip Time**

```
void MeasurePingLatency(WebSocket *ws) {
 uint32_t sent_tick;

 // Send ping and record timestamp
 if (ws->Ping(0, &sent_tick) != 0) {
 printf("Failed to send ping\n");
 return;
 }

 // Wait for pong (5 second timeout)
 int result = ws->WaitForPingReply(TICKS_PER_SECOND * 5);

 if (result == 0) {
 uint32_t reply_tick;
 ws->GetPingReplyTick(&reply_tick);

 // Calculate precise RTT
 uint32_t rtt_ticks = reply_tick - sent_tick;
 float rtt_ms = (rtt_ticks * 1000.0f) / TICKS_PER_SECOND;

 printf("Latency: %.3f ms\n", rtt_ms);
 } else {
 printf("Ping timeout - connection may be dead\n");
 }
}
```

### Connection Liveness Test

```
bool TestConnectionLiveness(WebSocket *ws) {
 uint32_t sent_tick;

 printf("Testing connection liveness...\n");

 // Send ping
 if (ws->Ping(0, &sent_tick) != 0) {
 printf("ERROR: Cannot send ping\n");
 return false;
 }

 // Short timeout for quick response detection
 int result = ws->WaitForPingReply(TICKS_PER_SECOND * 2);

 if (result == 0) {
 printf("Connection is ALIVE\n");
 return true;
 } else {
 printf("Connection is DEAD or SLOW\n");
 return false;
 }
}
```

### Multiple Timeout Strategy

```
bool SmartPingWait(WebSocket *ws) {
 uint32_t sent_tick;

 if (ws->Ping(0, &sent_tick) != 0) {
 return false;
 }

 // First try short timeout (fast network)
 if (ws->WaitForPingReply(TICKS_PER_SECOND) == 0) {
 printf("Fast response received\n");
 return true;
 }

 printf("No quick response, waiting longer...\n");

 // Try longer timeout (slow network)
 if (ws->WaitForPingReply(TICKS_PER_SECOND * 5) == 0) {
 printf("Slow response received\n");
 return true;
 }

 printf("No response - connection timeout\n");
 return false;
}
```

### Periodic Health Monitoring

```
void HealthMonitorTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;
 int consecutive_failures = 0;
 const int MAX_FAILURES = 3;

 while (1) {
 if (ws->GetState() == WS_STATE_OPEN) {
 uint32_t sent_tick;

 if (ws->Ping(0, &sent_tick) == 0) {
 int result = ws->WaitForPingReply(TICKS_PER_SECOND * 3);

 if (result == 0) {
 // Success - reset failure counter
 consecutive_failures = 0;
 printf("Health check passed\n");
 } else {
 // Timeout
 consecutive_failures++;
 printf("Health check failed (%d/%d)\n",
 consecutive_failures, MAX_FAILURES);

 if (consecutive_failures >= MAX_FAILURES) {
 printf("Connection declared dead, closing\n");
 ws->close();
 break;
 }
 }
 }
 }
 }

 // Check every 30 seconds
}
```

```

 OSTimeDly(TICKS_PER_SECOND * 30);
 }
}

```

### Non-blocking Alternative Pattern

```

// For comparison - non-blocking approach
void NonBlockingPingCheck(WebSocket *ws) {
 static uint32_t ping_sent_tick = 0;
 static bool ping_pending = false;

 if (!ping_pending) {
 // Send new ping
 if (ws->Ping(0, &ping_sent_tick) == 0) {
 ping_pending = true;
 printf("Ping sent\n");
 }
 } else {
 // Check if pong received
 uint32_t reply_tick;
 if (ws->GetPingReplyTick(&reply_tick) == 0) {
 if (reply_tick > ping_sent_tick) {
 // Pong received
 uint32_t rtt = reply_tick - ping_sent_tick;
 printf("Pong received, RTT: %lu ticks\n", rtt);
 ping_pending = false;
 }
 }

 // Check for timeout
 if ((TimeTick - ping_sent_tick) > (TICKS_PER_SECOND * 5)) {
 printf("Ping timeout\n");
 ping_pending = false;
 }
 }
}

```

### Connection Quality Assessment

```

typedef enum {
 QUALITY_EXCELLENT, // < 50ms
 QUALITY_GOOD, // 50-200ms
 QUALITY_FAIR, // 200-500ms
 QUALITY_POOR // > 500ms or timeout
} ConnectionQuality;

ConnectionQuality AssessConnectionQuality(WebSocket *ws) {
 uint32_t sent_tick;

 if (ws->Ping(0, &sent_tick) != 0) {
 return QUALITY_POOR;
 }

 if (ws->WaitForPingReply(TICKS_PER_SECOND * 2) != 0) {
 // Timeout
 return QUALITY_POOR;
 }

 uint32_t reply_tick;
 ws->GetPingReplyTick(&reply_tick);

 float rtt_ms = ((reply_tick - sent_tick) * 1000.0f) / TICKS_PER_SECOND;

 if (rtt_ms < 50.0f) {
 return QUALITY_EXCELLENT;
 } else if (rtt_ms < 200.0f) {
 return QUALITY_GOOD;
 } else if (rtt_ms < 500.0f) {
 return QUALITY_FAIR;
 } else {
 return QUALITY_POOR;
 }
}

```

#### 16.190.30.3 WriteData()

```

int NB::WebSocket::WriteData (
 const char * buf,
 int nbytes)

```

Write data to the [WebSocket](#) connection.

## Parameters

|               |                                            |
|---------------|--------------------------------------------|
| <i>buf</i>    | Pointer to buffer containing data to write |
| <i>nbytes</i> | Number of bytes to write from the buffer   |

## Returns

int Number of bytes actually written on success, negative value on error

This member function writes data to the [WebSocket](#) connection with automatic frame encoding. The function handles the [WebSocket](#) protocol overhead, allowing the application to send raw data that will be properly framed for transmission.

Key characteristics:

- Automatically creates [WebSocket](#) frames with appropriate headers
- Applies masking if required by protocol direction (client to server)
- Handles message fragmentation for large payloads automatically
- Buffers data for efficient transmission
- Respects current frame type setting (text or binary mode)

The function operates according to the [WebSocket](#) options set via [setoption\(\)](#):

- WS\_SO\_TEXT: Data is sent as text frames (default)
- WS\_SO\_BINARY: Data is sent as binary frames

Return value interpretation:

- Positive value: Number of bytes successfully queued for transmission
- Zero: No bytes written (unusual, may indicate buffer full)
- Negative: [Error](#) occurred (connection closed, invalid parameters, etc.)

## Note

The function may return successfully even if data hasn't been physically transmitted yet. Use [Flush\(\)](#) to ensure immediate transmission.

For large messages, the function may fragment data into multiple [WebSocket](#) frames automatically according to the protocol specification.

Written data is buffered in the transmit buffer. Check [GetWriteSpace\(\)](#) before writing if buffer space is a concern.

## Warning

Always check the return value. A negative return indicates the write failed and the connection may need to be closed.

The buffer pointer must remain valid for the duration of the call. Do not pass stack buffers that will go out of scope.

## See also

[ReadData\(\)](#) for reading data from the [WebSocket](#)  
[Flush\(\)](#) to force immediate transmission of buffered data  
[GetWriteSpace\(\)](#) to check available buffer space  
[setoption\(\)](#) to configure text or binary frame mode

## Example Usage

### Expand for Example Usage

#### Examples

##### Basic Text Write

```
WebSocket *ws = GetActiveWebSocket();
const char *message = "Hello, WebSocket!";

int bytes_written = ws->WriteData(message, strlen(message));
if (bytes_written > 0) {
 printf("Sent %d bytes\n", bytes_written);
} else {
 printf("Failed to send message, error: %d\n", bytes_written);
}
```

##### Write with Error Handling

```
int SafeWrite(WebSocket *ws, const char *data, int length) {
 if (data == nullptr || length <= 0) {
 printf("ERROR: Invalid write parameters\n");
 return -1;
 }

 if (ws->GetState() != WS_STATE_OPEN) {
 printf("ERROR: Connection not open\n");
 return -1;
 }

 int bytes_written = ws->WriteData(data, length);

 if (bytes_written == length) {
 // All data written successfully
 return bytes_written;
 } else if (bytes_written > 0) {
 // Partial write
 printf("WARNING: Partial write (%d of %d bytes)\n",
 bytes_written, length);
 return bytes_written;
 } else {
 // Write failed
 printf("ERROR: Write failed\n");
 return -1;
 }
}
```

##### Binary Data Transmission

```
bool SendBinaryData(WebSocket *ws, const uint8_t *data, int length) {
 // Ensure binary mode is enabled
 ws->setoption(WS_SO_BINARY);

 printf("Sending %d bytes of binary data...\n", length);

 int bytes_written = ws->WriteData((const char *)data, length);

 if (bytes_written == length) {
 printf("Binary data sent successfully\n");
 return true;
 } else {
 printf("ERROR: Binary send failed\n");
 return false;
 }
}
```

##### JSON Message Transmission

```
bool SendJsonMessage(WebSocket *ws, const char *json_str) {
 // Ensure text mode for JSON
 ws->setoption(WS_SO_TEXT);

 int length = strlen(json_str);
 printf("Sending JSON (%d bytes): %s\n", length, json_str);

 int bytes_written = ws->WriteData(json_str, length);

 if (bytes_written == length) {
 ws->Flush(); // Ensure immediate delivery
 return true;
 } else {
 printf("ERROR: JSON send failed\n");
 return false;
 }
}
```

### Formatted Message Writing

```
int WriteFormattedMessage(WebSocket *ws, const char *format, ...) {
 char buffer[512];
 va_list args;

 va_start(args, format);
 int length = vsnprintf(buffer, sizeof(buffer), format, args);
 va_end(args);

 if (length > 0 && length < (int)sizeof(buffer)) {
 int result = ws->WriteData(buffer, length);

 if (result > 0) {
 ws->Flush();
 printf("Formatted message sent: %s\n", buffer);
 }

 return result;
 } else {
 printf("ERROR: Message too large for buffer\n");
 return -1;
 }
}

// Usage:
WriteFormattedMessage(ws, "{\"sensor\":\"%s\",\"value\":%.2f}",
 "temperature", 23.45);
```

### Large Data Transfer with Chunking

```
bool WriteLargeData(WebSocket *ws, const char *data, int total_length) {
 const int CHUNK_SIZE = 1024;
 int bytes_sent = 0;

 printf("Sending large payload: %d bytes\n", total_length);

 while (bytes_sent < total_length) {
 // Check buffer space
 int space = ws->GetWriteSpace();
 if (space < 256) {
 printf("Buffer low, flushing...\n");
 ws->Flush();
 OSTimeDly(TICKS_PER_SECOND / 10);
 }

 // Calculate chunk size
 int remaining = total_length - bytes_sent;
 int to_send = (remaining > CHUNK_SIZE) ? CHUNK_SIZE : remaining;

 // Write chunk
 int bytes_written = ws->WriteData(data + bytes_sent, to_send);

 if (bytes_written > 0) {
 bytes_sent += bytes_written;
 printf("Progress: %d/%d bytes (%.1f%%)\n",
 bytes_sent, total_length,
 (bytes_sent * 100.0f) / total_length);
 } else {
 printf("ERROR: Write failed at %d bytes\n", bytes_sent);
 return false;
 }
 }

 ws->Flush();
 printf("Large data transfer complete\n");
 return true;
}
```

### Streaming Sensor Data

```
void StreamSensorReadings(WebSocket *ws) {
 char buffer[128];

 while (IsStreamingEnabled()) {
 // Read sensors
 float temp = ReadTemperature();
 float humidity = ReadHumidity();
 float pressure = ReadPressure();

 // Format as JSON
 snprintf(buffer, sizeof(buffer),
 "{\"temp\":%.2f,\"humidity\":%.2f,\"pressure\":%.2f}",
 temp, humidity, pressure);

 // Write and flush for real-time delivery
```

```

 int written = ws->WriteData(buffer, strlen(buffer));
 if (written > 0) {
 ws->Flush();
 } else {
 printf("WARNING: Failed to send sensor data\n");
 }
 OSTimeDly(TICKS_PER_SECOND);
 }
}

```

### Broadcast to Multiple WebSockets

```

void BroadcastMessage(const char *message) {
 int length = strlen(message);
 int success_count = 0;
 int fail_count = 0;

 printf("Broadcasting: %s\n", message);

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSocketStructs[i];

 if (ws->GetState() == WS_STATE_OPEN) {
 int written = ws->WriteData(message, length);

 if (written == length) {
 ws->Flush();
 success_count++;
 } else {
 fail_count++;
 }
 }
 }

 printf("Broadcast complete: %d sent, %d failed\n",
 success_count, fail_count);
}

```

### Write with Buffer Space Check

```

bool WriteWithSpaceCheck(WebSocket *ws, const char *data, int length) {
 int available = ws->GetWriteSpace();

 if (available < length) {
 printf("Insufficient buffer space: need %d, have %d\n",
 length, available);

 // Flush and retry
 ws->Flush();
 OSTimeDly(TICKS_PER_SECOND / 10);

 available = ws->GetWriteSpace();
 if (available < length) {
 printf("ERROR: Still insufficient space after flush\n");
 return false;
 }
 }

 int written = ws->WriteData(data, length);
 return (written == length);
}

```

### Rate-Limited Writing

```

void WriteWithRateLimit(WebSocket *ws, const char *data, int length,
 int max_bytes_per_second) {
 int bytes_sent = 0;
 uint32_t start_time = Secs;

 while (bytes_sent < length) {
 // Calculate how much we can send this second
 uint32_t elapsed = Secs - start_time;
 int allowed = (elapsed + 1) * max_bytes_per_second;
 int to_send = allowed - bytes_sent;

 if (to_send > (length - bytes_sent)) {
 to_send = length - bytes_sent;
 }

 if (to_send > 0) {
 int written = ws->WriteData(data + bytes_sent, to_send);
 if (written > 0) {
 bytes_sent += written;
 }
 }
 }
}

```

```
 }

 OSTimeDly(TICKS_PER_SECOND / 10);
}

ws->Flush();
printf("Rate-limited transfer complete: %d bytes\n", bytes_sent);
}
```

#### 16.190.30.4 ws\_clroption()

```
static int NB::WebSocket::ws_clroption (
 int fd,
 int option) [static]
```

Clear a socket option on a [WebSocket](#) connection.

##### Parameters

|               |                                                              |
|---------------|--------------------------------------------------------------|
| <i>fd</i>     | The <a href="#">WebSocket</a> file descriptor                |
| <i>option</i> | The socket option to clear (e.g., SO_KEEPALIVE, TCP_NODELAY) |

##### Returns

int Returns 0 on success, negative value on failure

This static wrapper function clears (disables) a specific socket option on the underlying socket associated with the [WebSocket](#) connection. It is the counterpart to [ws\\_setoption\(\)](#) and allows you to disable previously enabled options. Clearing an option returns the socket to its default behavior for that particular setting. This is useful when you need to dynamically adjust socket behavior based on runtime conditions or when reverting configuration changes.

##### Note

Clearing an option that was never set has no effect and typically succeeds.

##### See also

[ws\\_setoption\(\)](#) for setting socket options

[ws\\_getoption\(\)](#) for querying current option state

##### Example Usage

---

#### Expand for Example Usage

##### Examples

###### Disable TCP Keepalive

```
int ws_fd = GetWebSocketFd();

// Disable keepalive (maybe to reduce network traffic)
if (ws_clroption(ws_fd, SO_KEEPALIVE) == 0) {
 printf("Keepalive disabled for WebSocket fd %d\n", ws_fd);
} else {
 printf("Failed to disable keepalive\n");
}
```

###### Re-enable Nagle's Algorithm

```
// Clear TCP_NODELAY to re-enable Nagle's algorithm
int ws_fd = GetActiveWebSocketFd();

if (ws_clroption(ws_fd, TCP_NODELAY) == 0) {
 printf("Nagle's algorithm re-enabled - buffering mode\n");
} else {
 printf("ERROR: Could not clear TCP_NODELAY option\n");
}
```

### Dynamic Option Management

```
void ToggleWebSocketMode(int ws_fd, bool lowLatencyMode) {
 if (lowLatencyMode) {
 // Enable low-latency settings
 ws_setopt(ws_fd, TCP_NODELAY);
 printf("Switched to low-latency mode\n");
 } else {
 // Disable low-latency, allow buffering
 ws_clroption(ws_fd, TCP_NODELAY);
 printf("Switched to standard mode\n");
 }
}
```

### Cleanup Before Reconnection

```
void ResetWebSocketOptions(int ws_fd) {
 // Clear all custom options before reconnecting
 ws_clroption(ws_fd, SO_KEEPALIVE);
 ws_clroption(ws_fd, TCP_NODELAY);
 ws_clroption(ws_fd, SO_REUSEADDR);

 printf("WebSocket options reset to defaults\n");
}
```

#### 16.190.30.5 ws\_externalclose()

```
static int NB::WebSocket::ws_externalclose (
 int fd) [static]
```

Close a [WebSocket](#) connection from an external caller.

#### Parameters

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>fd</i> | The <a href="#">WebSocket</a> file descriptor to close |
|-----------|--------------------------------------------------------|

#### Returns

int Returns 0 on success, negative value on failure

This static wrapper function provides a mechanism to close a [WebSocket](#) connection from external code (outside the [WebSocket](#) class). It performs a clean shutdown of the [WebSocket](#), including:

- Sending a [WebSocket](#) close frame to the peer
- Flushing any pending data in buffers
- Releasing associated resources
- Removing the connection from the [WebSocket](#) registry

This function differs from a simple socket [close\(\)](#) by properly handling the [WebSocket](#) protocol's closing handshake, ensuring graceful disconnection.

#### Note

After calling this function, the file descriptor should not be used for any further operations.

#### Warning

Do not call standard [close\(\)](#) on a [WebSocket](#) file descriptor. Always use this function to ensure proper cleanup of [WebSocket](#) resources.

#### See also

[ws\\_flush\(\)](#) to flush buffers before closing

## Example Usage

### Expand for Example Usage

#### Examples

##### Basic Close

```
int ws_fd = GetActiveWebSocketFd();

// Close the WebSocket connection
if (ws_externalclose(ws_fd) == 0) {
 printf("WebSocket fd %d closed successfully\n", ws_fd);
} else {
 printf("Failed to close WebSocket fd %d\n", ws_fd);
}
```

##### Close with Flush

```
void CleanCloseWebSocket(int ws_fd) {
 // Ensure all pending data is sent before closing
 ws_flush(ws_fd);

 // Now close the connection
 int result = ws_externalclose(ws_fd);
 if (result == 0) {
 printf("WebSocket cleanly closed\n");
 } else {
 printf("ERROR: Failed to close WebSocket, code: %d\n", result);
 }
}
```

##### Timeout-based Close

```
void CloseIdleWebSockets(uint32_t maxIdleSeconds) {
 uint32_t currentTime = Secs;

 for (int i = 0; i < MAX_WEBSOCKETS; i++) {
 WebSocket *ws = GetWebSocketByIndex(i);
 if (ws != nullptr) {
 uint32_t idleTime = currentTime - ws->GetLastActivityTime();

 if (idleTime > maxIdleSeconds) {
 int fd = ws->GetFd();
 printf("Closing idle WebSocket fd %d (idle %lu sec)\n",
 fd, idleTime);
 ws_externalclose(fd);
 }
 }
 }
}
```

##### Error Condition Close

```
void HandleWebSocketError(int ws_fd, int error_code) {
 printf("WebSocket error %d on fd %d, closing connection\n",
 error_code, ws_fd);

 // Attempt to close gracefully
 if (ws_externalclose(ws_fd) != 0) {
 printf("WARNING: Error during close, connection may not be clean\n");
 }
}
```

##### Shutdown All WebSockets

```
void ShutdownAllWebSockets() {
 printf("Shutting down all WebSocket connections...\n");

 int closed_count = 0;
 int error_count = 0;

 for (int i = 0; i < MAX_WEBSOCKETS; i++) {
 WebSocket *ws = GetWebSocketByIndex(i);
 if (ws != nullptr) {
 int fd = ws->GetFd();

 // Flush before closing
 ws_flush(fd);

 if (ws_externalclose(fd) == 0) {
 closed_count++;
 } else {
 error_count++;
 printf("ERROR: Failed to close WebSocket fd %d\n", fd);
 }
 }
 }
}
```

```

 }
}

printf("Shutdown complete: %d closed, %d errors\n",
 closed_count, error_count);
}

```

### Conditional Close

```

void CloseWebSocketIfCondition(int ws_fd, bool force) {
 WebSocket *ws = GetWebSocketRecord(ws_fd);

 if (ws == nullptr) {
 printf("Invalid WebSocket fd: %d\n", ws_fd);
 return;
 }

 // Check if there's pending data
 if (!force && ws->HasPendingData()) {
 printf("WebSocket has pending data, flushing before close\n");
 ws_flush(ws_fd);
 OSTimeDly(TICKS_PER_SECOND / 10); // Brief delay for flush
 }

 ws_externalclose(ws_fd);
}

```

#### 16.190.30.6 ws\_flush()

```

static void NB::WebSocket::ws_flush (
 int fd) [static]

```

Flush the transmit buffer of a [WebSocket](#) connection.

#### Parameters

|           |                                               |
|-----------|-----------------------------------------------|
| <i>fd</i> | The <a href="#">WebSocket</a> file descriptor |
|-----------|-----------------------------------------------|

This static wrapper function forces any pending data in the [WebSocket](#)'s transmit buffer to be sent immediately to the peer. Normally, the [WebSocket](#) implementation may buffer small amounts of data to optimize network usage, but this function ensures immediate transmission.

Common use cases include:

- Before closing a connection to ensure all data is sent
- After sending critical messages that need immediate delivery
- When implementing real-time protocols with strict timing requirements
- Before entering low-power or idle states

#### Note

This function blocks until the buffer is flushed or a timeout occurs. The actual transmission completion depends on network conditions and the peer's receive capability.

#### Warning

Excessive flushing can reduce network efficiency. Use only when immediate transmission is required.

#### See also

[ws\\_externalclose\(\)](#) which should be called after flushing when closing

#### Example Usage

---

### Expand for Example Usage Examples

### Basic Flush

```
int ws_fd = GetActiveWebSocketFd();

// Send some data
SendWebSocketData(ws_fd, "Important message");

// Ensure it's sent immediately
ws_flush(ws_fd);
printf("Data flushed to network\n");
```

### Flush Before Close

```
void SafeCloseWebSocket(int ws_fd) {
 // Send final message
 SendWebSocketText(ws_fd, "Goodbye!");

 // Ensure message is sent before closing
 ws_flush(ws_fd);

 // Small delay to allow network transmission
 OSTimeDly(TICKS_PER_SECOND / 20);

 // Now safe to close
 ws_externalclose(ws_fd);
}
```

### Critical Message Delivery

```
void SendCriticalAlert(int ws_fd, const char *alert_msg) {
 // Send alert message
 SendWebSocketText(ws_fd, alert_msg);

 // Flush immediately - this is critical
 ws_flush(ws_fd);

 printf("Critical alert sent and flushed: %s\n", alert_msg);
}
```

### Real-time Data Streaming

```
void StreamSensorData(int ws_fd) {
 while (IsStreamingActive()) {
 // Read sensor
 float temperature = ReadTemperature();
 float humidity = ReadHumidity();

 // Format and send
 char buffer[128];
 snprintf(buffer, sizeof(buffer),
 "{\temp\":%.2f,\humidity\":%.2f}",
 temperature, humidity);
 SendWebSocketText(ws_fd, buffer);

 // Flush for real-time delivery
 ws_flush(ws_fd);

 // Wait before next reading
 OSTimeDly(TICKS_PER_SECOND);
 }
}
```

### Batch Send with Flush

```
void SendBatchData(int ws_fd, const char **messages, int count) {
 for (int i = 0; i < count; i++) {
 SendWebSocketText(ws_fd, messages[i]);
 }

 // Flush all messages at once
 ws_flush(ws_fd);

 printf("Sent and flushed %d messages\n", count);
}
```

### Command-Response Pattern

```
void HandleWebSocketCommand(int ws_fd, const char *command) {
 char response[256];

 // Process command
 ProcessCommand(command, response, sizeof(response));

 // Send response
 SendWebSocketText(ws_fd, response);
}
```

```

 // Flush to ensure client receives response promptly
 ws_flush(ws_fd);

 printf("Command processed and response sent\n");
 }

```

### Periodic Heartbeat

```

void WebSocketHeartbeatTask(void *pd) {
 int ws_fd = GetWebSocketFd();

 while (IsConnected(ws_fd)) {
 // Send ping/heartbeat
 SendWebSocketPing(ws_fd);

 // Flush to ensure timely delivery
 ws_flush(ws_fd);

 // Wait for next heartbeat interval
 OSTimeDly(TICKS_PER_SECOND * 30); // 30 second heartbeat
 }
}

```

### Error Recovery

```

void RecoverFromBufferOverflow(int ws_fd) {
 printf("Buffer overflow detected, flushing...\n");

 // Attempt to flush buffer
 ws_flush(ws_fd);

 // Check if connection is still valid
 int options = ws_getoption(ws_fd);
 if (options < 0) {
 printf("Connection lost after flush, closing\n");
 ws_externalclose(ws_fd);
 } else {
 printf("Buffer flushed successfully, connection stable\n");
 }
}

```

## 16.190.30.7 ws\_getoption()

```

static int NB::WebSocket::ws_getoption (
 int fd) [static]

```

Get the current socket options for a [WebSocket](#) connection.

### Parameters

|           |                                               |
|-----------|-----------------------------------------------|
| <i>fd</i> | The <a href="#">WebSocket</a> file descriptor |
|-----------|-----------------------------------------------|

### Returns

int A bitmask of currently enabled socket options, or negative value on failure

This static wrapper function retrieves the current state of socket options for the underlying socket associated with the [WebSocket](#) connection. It returns a bitmask where each bit represents a specific socket option's state (enabled/disabled).

The returned value can be tested against specific option flags to determine if particular options are currently enabled. This is useful for:

- Debugging socket configuration
- Verifying option settings
- Conditionally changing options based on current state
- Logging socket configuration

**Note**

The exact interpretation of the returned bitmask depends on the underlying socket implementation and available options.

**See also**

[ws\\_setopt\(\)](#) for setting socket options

[ws\\_clroption\(\)](#) for clearing socket options

**Example Usage****Expand for Example Usage****Examples****Query Current Options**

```
int ws_fd = GetWebSocketFd();

int options = ws_getoption(ws_fd);
if (options >= 0) {
 printf("Current socket options: 0x%08X\n", options);
} else {
 printf("Failed to get socket options\n");
}
```

**Check Specific Option**

```
int ws_fd = GetActiveWebSocketFd();
int options = ws_getoption(ws_fd);

if (options >= 0) {
 if (options & SO_KEEPALIVE) {
 printf("Keepalive is ENABLED\n");
 } else {
 printf("Keepalive is DISABLED\n");
 }

 if (options & TCP_NODELAY) {
 printf("Nagle's algorithm is DISABLED (low latency mode)\n");
 } else {
 printf("Nagle's algorithm is ENABLED (buffering mode)\n");
 }
}
```

**Conditional Option Setting**

```
void EnsureKeepaliveEnabled(int ws_fd) {
 int options = ws_getoption(ws_fd);

 if (options < 0) {
 printf("ERROR: Cannot read socket options\n");
 return;
 }

 // Only set keepalive if not already enabled
 if (!(options & SO_KEEPALIVE)) {
 ws_setopt(ws_fd, SO_KEEPALIVE);
 printf("Keepalive was disabled, now enabled\n");
 } else {
 printf("Keepalive already enabled\n");
 }
}
```

**Diagnostic Logging**

```
void LogWebSocketConfiguration(int ws_fd) {
 int options = ws_getoption(ws_fd);

 if (options < 0) {
 printf("ERROR: Could not retrieve socket options\n");
 return;
 }

 printf("=== WebSocket Configuration (fd %d) ===\n", ws_fd);
 printf("SO_KEEPALIVE: %s\n", (options & SO_KEEPALIVE) ? "ON" : "OFF");
 printf("TCP_NODELAY: %s\n", (options & TCP_NODELAY) ? "ON" : "OFF");
 printf("SO_REUSEADDR: %s\n", (options & SO_REUSEADDR) ? "ON" : "OFF");
 printf("Raw bitmask: 0x%08X\n", options);
 printf("=====\n");
}
```

### Option Comparison

```
void CompareWebSocketOptions(int ws_fd1, int ws_fd2) {
 int options1 = ws_getoption(ws_fd1);
 int options2 = ws_getoption(ws_fd2);

 if (options1 < 0 || options2 < 0) {
 printf("ERROR: Could not retrieve options for comparison\n");
 return;
 }

 if (options1 == options2) {
 printf("Both WebSockets have identical options\n");
 } else {
 printf("WebSocket options differ:\n");
 printf(" WS1: 0x%08X\n", options1);
 printf(" WS2: 0x%08X\n", options2);
 printf(" XOR: 0x%08X\n", options1 ^ options2);
 }
}
```

### 16.190.30.8 ws\_read()

```
static int NB::WebSocket::ws_read (
 int fd,
 char * buf,
 int nbytes) [static]
```

Read data from a [WebSocket](#) connection.

#### Parameters

|               |                                                      |
|---------------|------------------------------------------------------|
| <i>fd</i>     | The <a href="#">WebSocket</a> file descriptor        |
| <i>buf</i>    | Pointer to buffer where received data will be stored |
| <i>nbytes</i> | Maximum number of bytes to read into the buffer      |

#### Returns

int Number of bytes actually read on success, 0 if no data available, negative value on error or connection closed

This static wrapper function reads data from a [WebSocket](#) connection into the provided buffer. It handles [WebSocket](#) frame decoding automatically, presenting the application data to the caller without protocol overhead.

The function behavior includes:

- Automatic [WebSocket](#) frame parsing and payload extraction
- Handling of fragmented messages
- Processing of control frames (ping, pong, close)
- Non-blocking read when no data is available

Return value interpretation:

- Positive value: Number of bytes read successfully
- Zero: No data currently available (non-blocking)
- Negative: [Error](#) occurred or connection closed

#### Note

The buffer must be large enough to hold the requested number of bytes. Reading less than the available data will leave remaining data for subsequent reads.

### Warning

Always check the return value. A return of 0 or negative indicates no data was read, which may require different handling than partial reads.

### See also

[ws\\_write\(\)](#) for sending data over the [WebSocket](#)

### Example Usage

#### Expand for Example Usage

##### Examples Basic Read

```
int ws_fd = GetActiveWebSocketFd();
char buffer[512];

int bytes_read = ws_read(ws_fd, buffer, sizeof(buffer) - 1);
if (bytes_read > 0) {
 buffer[bytes_read] = '\0'; // Null terminate for string operations
 printf("Received %d bytes: %s\n", bytes_read, buffer);
} else if (bytes_read == 0) {
 printf("No data available\n");
} else {
 printf("Error reading from WebSocket\n");
}
```

##### Read with Error Handling

```
int SafeWebSocketRead(int ws_fd, char *buffer, int buffer_size) {
 if (buffer == nullptr || buffer_size <= 0) {
 printf("ERROR: Invalid buffer parameters\n");
 return -1;
 }

 int bytes_read = ws_read(ws_fd, buffer, buffer_size - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 return bytes_read;
 } else if (bytes_read == 0) {
 // No data available, not an error
 return 0;
 } else {
 // Connection error or closed
 printf("WebSocket read error, closing connection\n");
 ws_externalclose(ws_fd);
 return -1;
 }
}
```

##### Continuous Reading Loop

```
void WebSocketReadTask(void *pd) {
 int ws_fd = GetWebSocketFd();
 char buffer[1024];

 while (1) {
 int bytes_read = ws_read(ws_fd, buffer, sizeof(buffer) - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 printf("Received: %s\n", buffer);

 // Process the received data
 ProcessWebSocketMessage(buffer, bytes_read);
 } else if (bytes_read < 0) {
 printf("Connection closed or error\n");
 break;
 }

 // Brief delay to prevent CPU spinning
 OSTimeDly(TICKS_PER_SECOND / 100);
 }

 printf("WebSocket read task exiting\n");
}
```

### JSON Message Reading

```
bool ReadJsonMessage(int ws_fd, char *json_buffer, int buffer_size) {
 int bytes_read = ws_read(ws_fd, json_buffer, buffer_size - 1);

 if (bytes_read > 0) {
 json_buffer[bytes_read] = '\0';

 // Validate it's valid JSON
 if (json_buffer[0] == '{' || json_buffer[0] == '[') {
 printf("Received JSON: %s\n", json_buffer);
 return true;
 } else {
 printf("WARNING: Non-JSON data received\n");
 return false;
 }
 }

 return false;
}
```

### Binary Data Reading

```
int ReadBinaryFrame(int ws_fd, uint8_t *data_buffer, int max_size) {
 int bytes_read = ws_read(ws_fd, (char *)data_buffer, max_size);

 if (bytes_read > 0) {
 printf("Received %d bytes of binary data\n", bytes_read);

 // Process binary data
 for (int i = 0; i < bytes_read; i++) {
 printf("%02X ", data_buffer[i]);
 }
 printf("\n");
 }

 return bytes_read;
}
```

### Multi-buffer Reading

```
void ReadLargeMessage(int ws_fd) {
 const int CHUNK_SIZE = 256;
 char chunk[CHUNK_SIZE];
 int total_bytes = 0;

 printf("Reading large message in chunks...\n");

 while (1) {
 int bytes_read = ws_read(ws_fd, chunk, CHUNK_SIZE - 1);

 if (bytes_read > 0) {
 chunk[bytes_read] = '\0';
 total_bytes += bytes_read;

 // Process this chunk
 ProcessChunk(chunk, bytes_read);
 } else if (bytes_read == 0) {
 // No more data available
 break;
 } else {
 printf("ERROR: Read failed\n");
 break;
 }
 }

 printf("Total bytes read: %d\n", total_bytes);
}
```

### Timeout-based Reading

```
int ReadWithTimeout(int ws_fd, char *buffer, int buffer_size,
 uint32_t timeout_ms) {
 uint32_t start_tick = TimeTick;
 uint32_t timeout_ticks = (timeout_ms * TICKS_PER_SECOND) / 1000;

 while (1) {
 int bytes_read = ws_read(ws_fd, buffer, buffer_size - 1);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 return bytes_read;
 } else if (bytes_read < 0) {
 // Error
 }
 }
}
```

```
 return -1;
 }

 // Check timeout
 if ((TimeTick - start_tick) > timeout_ticks) {
 printf("Read timeout after %lu ms\n", timeout_ms);
 return 0; // Timeout
 }

 OSTimeDly(TICKS_PER_SECOND / 100);
}
}
```

### 16.190.30.9 ws\_read\_notify()

```
static void NB::WebSocket::ws_read_notify (
 int fd) [static]
```

TCP read notification callback invoked when data is available on the [WebSocket](#).

### 16.190.31 Description

This static callback function is invoked by the NetBurner TCP/IP stack when data becomes available to read on the [WebSocket](#) file descriptor. It handles incoming [WebSocket](#) frames, processes control frames (ping, pong, close), and delivers data frames to the application layer.

### 16.190.32 Parameters

#### Parameters

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>fd</i> | The file descriptor of the TCP socket with available data |
|-----------|-----------------------------------------------------------|

### 16.190.33 Usage Notes

- Automatically called by the network stack, not invoked directly by user code
- Should process all available data to avoid notification storms
- Must handle partial frames and buffering appropriately
- Should be non-blocking to prevent stalling the network stack
- Typically registered via `SetSocketReadNotify()` or similar

### 16.190.34 WebSocket Frame Handling

This callback must handle:

- Data frames (text/binary)
- Control frames (ping, pong, close)
- Frame fragmentation
- Opcode validation

### 16.190.35 Thread Safety

Called from the network stack context. Ensure thread-safe access to shared resources.

## Expand for Example Usage

### Examples

#### Example 1: Basic Read Notification Setup

```
class WebSocketHandler {
private:
 static void ws_read_notify(int fd) {
 char buffer[1024];
 int bytesRead = read(fd, buffer, sizeof(buffer));

 if (bytesRead > 0) {
 printf("Received %d bytes on fd %d\r\n", bytesRead, fd);
 ProcessWebSocketFrame(buffer, bytesRead);
 }
 else if (bytesRead == 0) {
 printf("Connection closed on fd %d\r\n", fd);
 close(fd);
 }
 }

public:
 void RegisterNotifications(int sockfd) {
 // Register read callback with TCP stack
 SetSocketReadNotify(sockfd, ws_read_notify);
 }
};
```

#### Example 2: WebSocket Frame Processing

```
static void ws_read_notify(int fd) {
 uint8_t frameBuffer[2048];
 int bytesRead = read(fd, frameBuffer, sizeof(frameBuffer));

 if (bytesRead <= 0) {
 HandleSocketError(fd, bytesRead);
 return;
 }

 // Parse WebSocket frame header
 bool fin = (frameBuffer[0] & 0x80) != 0;
 uint8_t opcode = frameBuffer[0] & 0x0F;

 switch (opcode) {
 case WS_OPCODE_TEXT:
 ProcessTextFrame(frameBuffer, bytesRead);
 break;
 case WS_OPCODE_BINARY:
 ProcessBinaryFrame(frameBuffer, bytesRead);
 break;
 case WS_OPCODE_PING:
 SendPong(fd, frameBuffer, bytesRead);
 break;
 case WS_OPCODE_CLOSE:
 HandleCloseFrame(fd);
 break;
 }
}
```

#### Example 3: Buffered Read with Error Handling

```
class WebSocketConnection {
private:
 static std::map<int, FrameBuffer> readBuffers;

 static void ws_read_notify(int fd) {
 const int CHUNK_SIZE = 512;
 uint8_t chunk[CHUNK_SIZE];

 // Read all available data
 while (true) {
 int bytesRead = read(fd, chunk, CHUNK_SIZE);

 if (bytesRead > 0) {
 // Append to frame buffer
 readBuffers[fd].Append(chunk, bytesRead);
 }
 }
 }
};
```

```

 // Try to parse complete frames
 while (readBuffers[fd].HasCompleteFrame()) {
 WebSocketFrame frame = readBuffers[fd].ExtractFrame();
 ProcessFrame(fd, frame);
 }
 }
 else if (bytesRead == 0) {
 printf("Connection closed gracefully: fd=%d\r\n", fd);
 CleanupConnection(fd);
 break;
 }
 else {
 // EWOULDBLOCK means no more data available
 if (errno == EWOULDBLOCK) break;

 printf("Read error on fd=%d: %d\r\n", fd, errno);
 CleanupConnection(fd);
 break;
 }
}
};

```

### 16.190.36.1 ws\_readwto()

```

static int NB::WebSocket::ws_readwto (
 int fd,
 char * buf,
 int nbytes,
 int timeout) [static]

```

Read data from a [WebSocket](#) connection with timeout.

#### Parameters

|                |                                                                     |
|----------------|---------------------------------------------------------------------|
| <i>fd</i>      | The <a href="#">WebSocket</a> file descriptor                       |
| <i>buf</i>     | Pointer to buffer where received data will be stored                |
| <i>nbytes</i>  | Maximum number of bytes to read into the buffer                     |
| <i>timeout</i> | Timeout value in system ticks (use TICKS_PER_SECOND for conversion) |

#### Returns

int Number of bytes actually read on success (positive value), 0 if timeout occurred with no data, negative value on error or connection closed

This static wrapper function reads data from a [WebSocket](#) connection with a specified timeout period. Unlike [ws\\_read\(\)](#) which returns immediately if no data is available, this function will wait up to the specified timeout for data to arrive.

The timeout mechanism allows for:

- Blocking reads with maximum wait time
- Prevention of indefinite blocking
- Periodic polling with controlled delays
- Responsive handling of slow or intermittent connections

Return value interpretation:

- Positive value: Number of bytes read successfully
- Zero: Timeout expired with no data received
- Negative: [Error](#) occurred or connection closed

The timeout parameter is specified in system ticks. Use TICKS\_PER\_SECOND to convert from seconds:

- 1 second: TICKS\_PER\_SECOND
- 500 ms: TICKS\_PER\_SECOND / 2
- 100 ms: TICKS\_PER\_SECOND / 10

**Note**

The buffer must be large enough to hold the requested number of bytes.

This function may return before the timeout if data becomes available or if an error occurs.

**Warning**

A timeout of 0 is equivalent to non-blocking mode (immediate return). Very large timeout values may block the calling task for extended periods.

**See also**

[ws\\_read\(\)](#) for non-blocking [read](#) operation

[ws\\_write\(\)](#) for sending data over the [WebSocket](#)

**Example Usage****Expand for Example Usage****Examples****Basic Read with Timeout**

```
int ws_fd = GetActiveWebSocketFd();
char buffer[512];

// Wait up to 5 seconds for data
int bytes_read = ws_readwto(ws_fd, buffer, sizeof(buffer) - 1,
 TICKS_PER_SECOND * 5);

if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 printf("Received %d bytes: %s\n", bytes_read, buffer);
} else if (bytes_read == 0) {
 printf("Timeout: No data received within 5 seconds\n");
} else {
 printf("Error reading from WebSocket\n");
}
```

**Request-Response Pattern**

```
bool SendRequestAndWaitForResponse(int ws_fd, const char *request) {
 char response[256];

 // Send request
 if (ws_write(ws_fd, request, strlen(request)) <= 0) {
 printf("Failed to send request\n");
 return false;
 }
 ws_flush(ws_fd);

 // Wait up to 10 seconds for response
 int bytes_read = ws_readwto(ws_fd, response, sizeof(response) - 1,
 TICKS_PER_SECOND * 10);

 if (bytes_read > 0) {
 response[bytes_read] = '\0';
 printf("Response received: %s\n", response);
 return true;
 } else if (bytes_read == 0) {
 printf("ERROR: Response timeout\n");
 return false;
 } else {
 printf("ERROR: Connection error\n");
 return false;
 }
}
```

**Polling Loop with Timeout**

```
void WebSocketPollingTask(void *pd) {
 int ws_fd = GetWebSocketFd();
 char buffer[1024];

 while (1) {
 // Poll with 1 second timeout
 int bytes_read = ws_readwto(ws_fd, buffer, sizeof(buffer) - 1,
 TICKS_PER_SECOND);
 }
```

```

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 printf("Data received: %s\n", buffer);
 ProcessWebSocketData(buffer, bytes_read);
 } else if (bytes_read == 0) {
 // Timeout - no data, continue polling
 // Could perform other tasks here
 } else {
 // Error - connection likely closed
 printf("Connection error, exiting\n");
 break;
 }
 }
}

```

### Short Timeout for Responsive UI

```

void CheckWebSocketWithShortTimeout(int ws_fd) {
 char buffer[256];

 // Very short timeout (100ms) for responsive checking
 int bytes_read = ws_readwto(ws_fd, buffer, sizeof(buffer) - 1,
 TICKS_PER_SECOND / 10);

 if (bytes_read > 0) {
 buffer[bytes_read] = '\0';
 UpdateUI(buffer);
 } else if (bytes_read == 0) {
 // Quick timeout, continue normal operation
 } else {
 // Connection error
 HandleConnectionError();
 }
}

```

### Multi-attempt Read with Retry

```

int ReadWithRetry(int ws_fd, char *buffer, int buffer_size,
 int attempts, uint32_t timeout_per_attempt) {
 for (int i = 0; i < attempts; i++) {
 int bytes_read = ws_readwto(ws_fd, buffer, buffer_size - 1,
 timeout_per_attempt);

 if (bytes_read > 0) {
 // Success
 buffer[bytes_read] = '\0';
 printf("Read successful on attempt %d\n", i + 1);
 return bytes_read;
 } else if (bytes_read == 0) {
 // Timeout, try again
 printf("Attempt %d timed out, retrying...\n", i + 1);
 } else {
 // Error, don't retry
 printf("Read error on attempt %d\n", i + 1);
 return -1;
 }
 }

 printf("All %d attempts failed\n", attempts);
 return 0; // All attempts timed out
}

// Usage:
char data[512];
// Try 3 times, 2 seconds each
int result = ReadWithRetry(ws_fd, data, sizeof(data), 3,
 TICKS_PER_SECOND * 2);

```

### Blocking Read Until Complete Message

```

bool ReadCompleteMessage(int ws_fd, char *buffer, int expected_size) {
 int total_read = 0;
 const int TIMEOUT = TICKS_PER_SECOND * 30; // 30 second total timeout

 printf("Reading complete message (%d bytes expected)...\n",
 expected_size);

 while (total_read < expected_size) {
 int remaining = expected_size - total_read;
 }
}

```

```

 int bytes_read = ws_readwto(ws_fd, buffer + total_read,
 remaining, TIMEOUT);

 if (bytes_read > 0) {
 total_read += bytes_read;
 printf("Progress: %d/%d bytes\n", total_read, expected_size);
 } else if (bytes_read == 0) {
 printf("ERROR: Timeout waiting for data\n");
 return false;
 } else {
 printf("ERROR: Read error\n");
 return false;
 }
}

buffer[total_read] = '\0';
printf("Complete message received\n");
return true;
}

```

### Adaptive Timeout Based on Activity

```

void AdaptiveReadLoop(int ws_fd) {
 char buffer[512];
 uint32_t timeout = TICKS_PER_SECOND; // Start with 1 second
 int consecutive_timeouts = 0;

 while (1) {
 int bytes_read = ws_readwto(ws_fd, buffer, sizeof(buffer) - 1,
 timeout);

 if (bytes_read > 0) {
 // Data received - reset to short timeout
 buffer[bytes_read] = '\0';
 ProcessData(buffer, bytes_read);
 timeout = TICKS_PER_SECOND;
 consecutive_timeouts = 0;
 } else if (bytes_read == 0) {
 // Timeout - increase timeout for next attempt
 consecutive_timeouts++;

 if (consecutive_timeouts > 3) {
 // Multiple timeouts, extend timeout to 5 seconds
 timeout = TICKS_PER_SECOND * 5;
 printf("Extended timeout due to inactivity\n");
 }
 } else {
 // Error
 printf("Connection error\n");
 break;
 }
 }
}

```

#### 16.190.36.2 ws\_setopt()

```

static int NB::WebSocket::ws_setopt (
 int fd,
 int option) [static]

```

Set a socket option on a [WebSocket](#) connection.

#### Parameters

|               |                                                            |
|---------------|------------------------------------------------------------|
| <i>fd</i>     | The <a href="#">WebSocket</a> file descriptor              |
| <i>option</i> | The socket option to set (e.g., SO_KEEPALIVE, TCP_NODELAY) |

#### Returns

int Returns 0 on success, negative value on failure

This static wrapper function sets a specific socket option on the underlying socket associated with the [WebSocket](#) connection. It provides a convenient interface to modify socket behavior without directly accessing the underlying TCP socket.

Common socket options include:

- `SO_KEEPALIVE`: Enable TCP keepalive packets
- `TCP_NODELAY`: Disable Nagle's algorithm for low-latency
- `SO_REUSEADDR`: Allow address reuse
- `SO_SNDBUF/SO_RCVBUF`: Adjust send/receive buffer sizes

**Note**

This function operates on the underlying TCP socket of the [WebSocket](#). Some options may not be applicable or may have unexpected behavior in [WebSocket](#) mode.

**Warning**

Setting incompatible socket options may disrupt [WebSocket](#) communication. Use with caution and test thoroughly.

**Example Usage****Expand for Example Usage****Examples****Enable TCP Keepalive**

```
WebSocket *ws = new WebSocket("ws://example.com");
int fd = ws->GetFd();

// Enable keepalive to detect dead connections
if (ws_setopt(fd, SO_KEEPALIVE) == 0) {
 printf("Keepalive enabled for WebSocket fd %d\n", fd);
} else {
 printf("Failed to enable keepalive\n");
}
```

**Disable Nagle's Algorithm**

```
// For low-latency applications, disable Nagle's algorithm
int ws_fd = GetActiveWebSocketFd();

if (ws_setopt(ws_fd, TCP_NODELAY) == 0) {
 printf("TCP_NODELAY enabled - reduced latency mode\n");
} else {
 printf("ERROR: Could not set TCP_NODELAY option\n");
}
```

**Multiple Options Setup**

```
void ConfigureWebSocketConnection(int ws_fd) {
 // Configure multiple socket options for optimal performance

 // Enable keepalive
 if (ws_setopt(ws_fd, SO_KEEPALIVE) != 0) {
 printf("Warning: Could not enable keepalive\n");
 }

 // Disable Nagle for low latency
 if (ws_setopt(ws_fd, TCP_NODELAY) != 0) {
 printf("Warning: Could not disable Nagle's algorithm\n");
 }

 printf("WebSocket connection configured\n");
}
```

**16.190.36.3 ws\_write()**

```
static int NB::WebSocket::ws_write (
 int fd,
 const char * buf,
 int nbytes) [static]
```

Write data to a [WebSocket](#) connection.

### Parameters

|               |                                               |
|---------------|-----------------------------------------------|
| <i>fd</i>     | The <a href="#">WebSocket</a> file descriptor |
| <i>buf</i>    | Pointer to buffer containing data to send     |
| <i>nbytes</i> | Number of bytes to write from the buffer      |

### Returns

int Number of bytes actually written on success, negative value on error

This static wrapper function writes data to a [WebSocket](#) connection with automatic [WebSocket](#) frame encoding. The function handles the protocol overhead, allowing the application to send raw data that will be properly framed for [WebSocket](#) transmission.

The function behavior includes:

- Automatic [WebSocket](#) frame creation with proper headers
- Masking of data (if required by protocol direction)
- Handling of message fragmentation for large payloads
- Buffering and flow control

Return value interpretation:

- Positive value: Number of bytes successfully queued for transmission
- Negative: [Error](#) occurred (connection closed, buffer full, invalid parameters)

### Note

The function may return successfully even if data hasn't been physically transmitted yet. Use [ws\\_flush\(\)](#) to ensure immediate transmission.

For large messages, the function may fragment the data into multiple [WebSocket](#) frames automatically.

### Warning

Always check the return value. A negative return indicates the write failed and the connection may need to be closed.

### See also

[ws\\_read\(\)](#) for reading data from the [WebSocket](#)

[ws\\_flush\(\)](#) to force immediate transmission of buffered data

### Example Usage

---

### Expand for Example Usage

#### Examples

##### Basic Write

```
int ws_fd = GetActiveWebSocketFd();
const char *message = "Hello, WebSocket!";

int bytes_written = ws_write(ws_fd, message, strlen(message));
if (bytes_written > 0) {
 printf("Sent %d bytes\n", bytes_written);
} else {
 printf("Failed to send message\n");
}
```

### Write with Error Handling

```

int SafeWebSocketWrite(int ws_fd, const char *data, int length) {
 if (data == nullptr || length <= 0) {
 printf("ERROR: Invalid write parameters\n");
 return -1;
 }

 int bytes_written = ws_write(ws_fd, data, length);

 if (bytes_written == length) {
 // All data written successfully
 return bytes_written;
 } else if (bytes_written > 0) {
 // Partial write
 printf("WARNING: Partial write (%d of %d bytes)\n",
 bytes_written, length);
 return bytes_written;
 } else {
 // Write failed
 printf("ERROR: Write failed, closing connection\n");
 ws_externalclose(ws_fd);
 return -1;
 }
}

```

### Write with Flush

```

void SendImmediateMessage(int ws_fd, const char *message) {
 int length = strlen(message);
 int bytes_written = ws_write(ws_fd, message, length);

 if (bytes_written > 0) {
 // Flush to ensure immediate delivery
 ws_flush(ws_fd);
 printf("Message sent and flushed: %s\n", message);
 } else {
 printf("Failed to send message\n");
 }
}

```

### JSON Message Transmission

```

bool SendJsonMessage(int ws_fd, const char *json_str) {
 int length = strlen(json_str);

 printf("Sending JSON (%d bytes): %s\n", length, json_str);

 int bytes_written = ws_write(ws_fd, json_str, length);

 if (bytes_written == length) {
 ws_flush(ws_fd); // Ensure JSON is sent immediately
 return true;
 } else {
 printf("ERROR: JSON send failed\n");
 return false;
 }
}

```

### Binary Data Transmission

```

int SendBinaryData(int ws_fd, const uint8_t *data, int data_length) {
 printf("Sending %d bytes of binary data...\n", data_length);

 int bytes_written = ws_write(ws_fd, (const char *)data, data_length);

 if (bytes_written == data_length) {
 printf("Binary data sent successfully\n");
 return bytes_written;
 } else if (bytes_written > 0) {
 printf("WARNING: Only sent %d of %d bytes\n",
 bytes_written, data_length);
 return bytes_written;
 } else {
 printf("ERROR: Binary send failed\n");
 return -1;
 }
}

```

## Formatted Message Transmission

```
void SendFormattedMessage(int ws_fd, const char *format, ...) {
 char buffer[512];
 va_list args;

 va_start(args, format);
 int length = vsnprintf(buffer, sizeof(buffer), format, args);
 va_end(args);

 if (length > 0 && length < (int)sizeof(buffer)) {
 int bytes_written = ws_write(ws_fd, buffer, length);

 if (bytes_written > 0) {
 ws_flush(ws_fd);
 printf("Formatted message sent: %s\n", buffer);
 } else {
 printf("Failed to send formatted message\n");
 }
 } else {
 printf("ERROR: Message too large for buffer\n");
 }
}

// Usage:
SendFormattedMessage(ws_fd, "{\"sensor\":\"%s\",\"value\":%.2f}",
 "temperature", 23.45);
```

## Large Data Transmission

```
bool SendLargePayload(int ws_fd, const char *data, int total_length) {
 const int CHUNK_SIZE = 1024;
 int bytes_sent = 0;

 printf("Sending large payload: %d bytes\n", total_length);

 while (bytes_sent < total_length) {
 int remaining = total_length - bytes_sent;
 int to_send = (remaining > CHUNK_SIZE) ? CHUNK_SIZE : remaining;

 int bytes_written = ws_write(ws_fd, data + bytes_sent, to_send);

 if (bytes_written > 0) {
 bytes_sent += bytes_written;
 printf("Progress: %d/%d bytes\n", bytes_sent, total_length);
 } else {
 printf("ERROR: Write failed at %d bytes\n", bytes_sent);
 return false;
 }

 // Brief delay between chunks
 OSTimeDly(TICKS_PER_SECOND / 100);
 }

 ws_flush(ws_fd);
 printf("Large payload sent successfully\n");
 return true;
}
```

## Broadcast to Multiple WebSockets

```
void BroadcastMessage(const char *message) {
 int length = strlen(message);
 int success_count = 0;
 int fail_count = 0;

 printf("Broadcasting message to all WebSockets: %s\n", message);

 for (int i = 0; i < MAX_WEBSOCKETS; i++) {
 WebSocket *ws = GetWebSocketByIndex(i);
 if (ws != nullptr) {
 int fd = ws->GetFd();
 int bytes_written = ws_write(fd, message, length);

 if (bytes_written == length) {
 ws_flush(fd);
 success_count++;
 } else {
 fail_count++;
 printf("WARNING: Failed to send to WebSocket %d\n", i);
 }
 }
 }

 printf("Broadcast complete: %d success, %d failed\n",
 success_count, fail_count);
}
```

```
}
```

### Echo Server Pattern

```
void WebSocketEchoHandler(int ws_fd) {
 char read_buffer[512];

 while (1) {
 int bytes_read = ws_read(ws_fd, read_buffer, sizeof(read_buffer) - 1);

 if (bytes_read > 0) {
 read_buffer[bytes_read] = '\0';

 // Echo back what was received
 int bytes_written = ws_write(ws_fd, read_buffer, bytes_read);

 if (bytes_written > 0) {
 ws_flush(ws_fd);
 printf("Echoed %d bytes\n", bytes_written);
 } else {
 printf("Echo write failed\n");
 break;
 }
 } else if (bytes_read < 0) {
 printf("Connection closed\n");
 break;
 }

 OSTimeDly(TICKS_PER_SECOND / 100);
 }
}
```

#### 16.190.36.4 ws\_write\_notify()

```
static void NB::WebSocket::ws_write_notify (
 int fd) [static]
```

TCP write notification callback invoked when buffer space becomes available.

### 16.190.37 Description

This static callback function is invoked by the NetBurner TCP/IP stack when the TCP send buffer has space available for writing. It allows the [WebSocket](#) handler to resume sending data that was previously blocked due to a full send buffer. This implements flow control for outbound [WebSocket](#) traffic.

### 16.190.38 Parameters

#### Parameters

|           |                                                                   |
|-----------|-------------------------------------------------------------------|
| <i>fd</i> | The file descriptor of the TCP socket with available buffer space |
|-----------|-------------------------------------------------------------------|

### 16.190.39 Usage Notes

- Automatically called by the network stack when send buffer space is available
- Essential for handling EWOULDBLOCK conditions on non-blocking sockets
- Should attempt to flush pending outbound data
- Must not block or perform lengthy operations
- Typically registered via `SetSocketWriteNotify()` or similar
- May be called multiple times as buffer space becomes available

### 16.190.40 Flow Control

This callback enables proper flow control by:

- Resuming writes after EWOULDBLOCK
- Preventing busy-waiting on socket writability
- Managing outbound message queues efficiently

### 16.190.41 Thread Safety

Called from the network stack context. Ensure thread-safe access to write queues.

### 16.190.42 See Also

#### Expand for Example Usage

##### Examples

##### Example 1: Basic Write Notification Setup

```
class WebSocketHandler {
private:
 static void ws_write_notify(int fd) {
 printf("Write space available on fd %d\r\n", fd);

 // Attempt to flush pending data
 if (HasPendingData(fd)) {
 FlushPendingData(fd);
 }
 }

public:
 void RegisterNotifications(int sockfd) {
 // Register write callback with TCP stack
 SetSocketWriteNotify(sockfd, ws_write_notify);
 }
};
```

##### Example 2: Message Queue Flushing

```
class WebSocketConnection {
private:
 static std::map<int, std::queue<WebSocketMessage> writeQueues;

 static void ws_write_notify(int fd) {
 auto& queue = writeQueues[fd];

 // Try to send queued messages
 while (!queue.empty()) {
 WebSocketMessage& msg = queue.front();

 int bytesSent = write(fd, msg.data, msg.length);

 if (bytesSent == msg.length) {
 // Complete message sent
 queue.pop();
 }
 else if (bytesSent > 0) {
 // Partial send - update message
 msg.data += bytesSent;
 msg.length -= bytesSent;
 break; // Wait for next notification
 }
 else {
 // EWOULDBLOCK - buffer full again
 if (errno == EWOULDBLOCK) break;

 // Error - close connection
 printf("Write error on fd=%d: %d\r\n", fd, errno);
 CleanupConnection(fd);
 break;
 }
 }
 }
};
```

```

 // Disable write notifications if queue empty
 if (queue.empty()) {
 SetSocketWriteNotify(fd, nullptr);
 }
 }
};

```

### Example 3: Advanced Flow Control with Backpressure

```

static void ws_write_notify(int fd) {
 ConnectionState* conn = GetConnection(fd);
 if (!conn) return;

 // Update connection state
 conn->writeBlocked = false;

 // Attempt to flush buffer
 while (conn->sendBuffer.HasData()) {
 const uint8_t* data = conn->sendBuffer.GetData();
 size_t length = conn->sendBuffer.GetLength();

 int bytesSent = write(fd, data, length);

 if (bytesSent > 0) {
 conn->sendBuffer.Consume(bytesSent);
 conn->totalBytesSent += bytesSent;

 if (bytesSent < (int)length) {
 // Partial write - buffer full again
 printf("Partial write: %d/%zu bytes\r\n", bytesSent, length);
 conn->writeBlocked = true;
 break;
 }
 }
 else if (errno == EWOULDBLOCK) {
 conn->writeBlocked = true;
 break;
 }
 else {
 // Error
 printf("Write failed on fd=%d: errno=%d\r\n", fd, errno);
 CloseConnection(fd);
 return;
 }
 }

 // Notify application that backpressure is relieved
 if (!conn->writeBlocked && conn->onWriteReady) {
 conn->onWriteReady(fd);
 }
}

```

## 16.190.43 Member Data Documentation

### 16.190.43.1 m\_fd\_tcp

int NB::WebSocket::m\_fd\_tcp

TCP socket file descriptor (underlying transport)

This member variable stores the file descriptor for the underlying TCP socket that provides the transport layer for the [WebSocket](#) connection. The TCP socket handles the actual network communication, while the [WebSocket](#) protocol operates on top of it.

Key characteristics:

- Created during initial connection establishment
- Used for all low-level socket operations (send, recv, setsockopt, etc.)
- Remains valid throughout the [WebSocket](#) connection lifetime
- Closed when the [WebSocket](#) connection is terminated

The TCP socket is typically established through one of two methods:

1. Client-initiated connection: Created via [connect\(\)](#) to a remote server
2. Server-accepted connection: Obtained from [accept\(\)](#) on a listening socket

After the [WebSocket](#) handshake completes, this socket is "promoted" to [WebSocket](#) mode, but the underlying TCP file descriptor remains the same and continues to handle the transport.

Common operations using this file descriptor:

- Reading raw data from the network
- Writing framed [WebSocket](#) data to the network
- Setting socket options (SO\_KEEPALIVE, TCP\_NODELAY, etc.)
- Checking socket status and errors
- Closing the connection

#### Note

This is the actual system socket file descriptor. Operations on this socket must be thread-safe when multiple tasks access the [WebSocket](#).

A value of -1 or similar invalid descriptor indicates no connection.

Direct manipulation of this file descriptor should be avoided in favor of using [WebSocket](#) member functions, which handle protocol requirements.

#### See also

[m\\_fd\\_ws](#) for the application-level [WebSocket](#) identifier

[socket\\_crit](#) for thread-safe access to socket operations

#### Example Usage

---

### Expand for Example Usage

#### Examples

##### Check if Socket is Valid

```
WebSocket *ws = GetActiveWebSocket();

if (ws->m_fd_tcp >= 0) {
 printf("TCP socket is valid (fd: %d)\n", ws->m_fd_tcp);
} else {
 printf("TCP socket is invalid\n");
}
```

##### Set Socket Options on TCP Layer

```
void ConfigureTcpSocket(WebSocket *ws) {
 if (ws->m_fd_tcp < 0) {
 printf("ERROR: Invalid TCP socket\n");
 return;
 }

 // Set TCP_NODELAY for low latency
 int flag = 1;
 if (setsockopt(ws->m_fd_tcp, IPPROTO_TCP, TCP_NODELAY,
 &flag, sizeof(flag)) == 0) {
 printf("TCP_NODELAY set on fd %d\n", ws->m_fd_tcp);
 }

 // Enable keepalive
 flag = 1;
 if (setsockopt(ws->m_fd_tcp, SOL_SOCKET, SO_KEEPALIVE,
 &flag, sizeof(flag)) == 0) {
 printf("SO_KEEPALIVE set on fd %d\n", ws->m_fd_tcp);
 }
}
```

### Get Socket Information

```

void DisplaySocketInfo(WebSocket *ws) {
 if (ws->m_fd_tcp < 0) {
 printf("No TCP socket\n");
 return;
 }

 // Get local address
 IPADDR local_addr;
 WORD local_port;
 GetSocketAddr(ws->m_fd_tcp, &local_addr, &local_port);

 // Get peer address
 IPADDR peer_addr;
 WORD peer_port;
 GetSocketPeer(ws->m_fd_tcp, &peer_addr, &peer_port);

 printf("TCP Socket Info (fd: %d):\n", ws->m_fd_tcp);
 printf(" Local: %s:%d\n", IPAddressToString(local_addr), local_port);
 printf(" Peer: %s:%d\n", IPAddressToString(peer_addr), peer_port);
}

```

### Check Socket Error Status

```

bool CheckSocketError(WebSocket *ws) {
 if (ws->m_fd_tcp < 0) {
 return true; // Invalid socket is an error
 }

 int error = 0;
 socklen_t len = sizeof(error);

 if (getsockopt(ws->m_fd_tcp, SOL_SOCKET, SO_ERROR,
 &error, &len) == 0) {
 if (error != 0) {
 printf("Socket error on fd %d: %d\n", ws->m_fd_tcp, error);
 return true;
 }
 }

 return false;
}

```

### Monitor Multiple WebSocket TCP Sockets

```

void MonitorAllTcpSockets() {
 printf("TCP Socket Status:\n");

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->GetState() != WS_STATE_CLOSED && ws->m_fd_tcp >= 0) {
 printf(" [%d] TCP fd=%d, WS fd=%d, State=%d\n",
 i, ws->m_fd_tcp, ws->m_fd_ws, ws->GetState());
 }
 }
}

```

### Get Socket Buffer Sizes

```

void DisplayBufferSizes(WebSocket *ws) {
 if (ws->m_fd_tcp < 0) {
 printf("Invalid socket\n");
 return;
 }

 int sndbuf, rcvbuf;
 socklen_t len = sizeof(int);

 getsockopt(ws->m_fd_tcp, SOL_SOCKET, SO_SNDBUF, &sndbuf, &len);
 getsockopt(ws->m_fd_tcp, SOL_SOCKET, SO_RCVBUF, &rcvbuf, &len);

 printf("TCP Socket %d Buffer Sizes:\n", ws->m_fd_tcp);
 printf(" Send buffer: %d bytes\n", sndbuf);
 printf(" Recv buffer: %d bytes\n", rcvbuf);
}

```

## 16.190.43.2 m\_fd\_ws

int NB::WebSocket::m\_fd\_ws

[WebSocket](#) file descriptor (application-level identifier)

This member variable stores an application-level file descriptor or identifier that represents this [WebSocket](#) connection. While `m_fd_tcp` represents the underlying TCP transport, `m_fd_ws` provides a WebSocket-specific identifier used by the [WebSocket](#) management system.

Key characteristics:

- Assigned when a TCP connection is promoted to a [WebSocket](#)
- Used to identify and look up [WebSocket](#) instances
- May differ from `m_fd_tcp` in systems with separate numbering schemes
- Used as a key in [WebSocket](#) registration/lookup operations

This identifier is used throughout the [WebSocket](#) API for operations such as:

- Finding a [WebSocket](#) instance via [GetWebSocketRecord\(\)](#)
- Static wrapper functions (`ws_read`, `ws_write`, etc.)
- Connection management and tracking
- Diagnostic and monitoring operations

In some implementations, `m_fd_ws` may equal `m_fd_tcp`, indicating the same file descriptor is used for both layers. In other implementations, they may be different to provide abstraction between layers.

#### Note

This identifier is set during [WebSocket](#) promotion (`promote_tcp_ws`).

A value of -1 or similar invalid identifier indicates no [WebSocket](#) has been established.

Application code should primarily use this identifier when calling WebSocket-specific functions rather than accessing `m_fd_tcp` directly.

#### See also

[m\\_fd\\_tcp](#) for the underlying TCP socket file descriptor

[GetWebSocketRecord\(\)](#) which uses this identifier to find [WebSocket](#) instances

#### Example Usage

---

### Expand for Example Usage

#### Examples

##### Get WebSocket Identifier

```
WebSocket *ws = GetActiveWebSocket();

if (ws->m_fd_ws >= 0) {
 printf("WebSocket identifier: %d\n", ws->m_fd_ws);
 printf("TCP socket: %d\n", ws->m_fd_tcp);
} else {
 printf("WebSocket not established\n");
}
```

##### Use WebSocket Identifier with Static Functions

```
void SendMessage(WebSocket *ws, const char *message) {
 int ws_fd = ws->m_fd_ws;

 if (ws_fd < 0) {
 printf("ERROR: Invalid WebSocket identifier\n");
 return;
 }

 // Use static wrapper functions with WebSocket identifier
 int result = ws_write(ws_fd, message, strlen(message));
 if (result > 0) {
 ws_flush(ws_fd);
 printf("Message sent via WebSocket %d\n", ws_fd);
 }
}
```

### Compare TCP and WebSocket Identifiers

```
void DisplayIdentifiers(WebSocket *ws) {
 printf("Connection Identifiers:\n");
 printf(" TCP fd: %d\n", ws->m_fd_tcp);
 printf(" WebSocket fd: %d\n", ws->m_fd_ws);

 if (ws->m_fd_tcp == ws->m_fd_ws) {
 printf(" (Same identifier used for both layers)\n");
 } else {
 printf(" (Separate identifiers for layers)\n");
 }
}
```

### Lookup WebSocket by Identifier

```
WebSocket* FindWebSocket(int ws_fd) {
 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->m_fd_ws == ws_fd) {
 printf("Found WebSocket at index %d\n", i);
 return ws;
 }
 }

 printf("WebSocket %d not found\n", ws_fd);
 return nullptr;
}
```

### Track Active WebSocket Identifiers

```
void ListActiveWebSockets() {
 printf("Active WebSocket Identifiers:\n");
 int count = 0;

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->m_fd_ws >= 0 && ws->GetState() == WS_STATE_OPEN) {
 printf(" [%d] WS fd=%d (TCP fd=%d)\n",
 i, ws->m_fd_ws, ws->m_fd_tcp);
 count++;
 }
 }

 printf("Total active: %d\n", count);
}
```

### Validate WebSocket Identifier

```
bool IsValidWebSocketId(int ws_fd) {
 if (ws_fd < 0) {
 return false;
 }

 // Check if this identifier belongs to an active WebSocket
 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];
 if (ws->m_fd_ws == ws_fd) {
 return true;
 }
 }

 return false;
}
```

## 16.190.43.3 s\_openSocketCount

```
int NB::WebSocket::s_openSocketCount [static]
```

Number of currently open [WebSocket](#) connections.

This static member variable tracks the total number of active [WebSocket](#) connections currently managed by the [WebSocket](#) system. It is incremented when a new [WebSocket](#) connection is established and decremented when a connection is closed.

This counter is useful for:

- Monitoring system resource usage
- Enforcing connection limits

- Diagnostics and debugging
- Load balancing decisions

The value ranges from 0 to `WS_MAX_SOCKETS` (the maximum number of concurrent [WebSocket](#) connections supported by the system).

#### Note

This is a static variable shared across all [WebSocket](#) instances. Access should be synchronized in multi-threaded environments.

#### See also

[WS\\_MAX\\_SOCKETS](#) for the maximum connection limit

[WSSockStruts](#) for the array of [WebSocket](#) structures

#### Example Usage

---

### Expand for Example Usage

#### Examples

##### Check Connection Count

```
void DisplayWebSocketStatus() {
 int active_connections = WebSocket::s_openSocketCount;
 printf("Active WebSocket connections: %d/%d\n",
 active_connections, WS_MAX_SOCKETS);

 if (active_connections >= WS_MAX_SOCKETS) {
 printf("WARNING: Maximum WebSocket connections reached!\n");
 }
}
```

##### Enforce Connection Limit

```
bool CanAcceptNewConnection() {
 if (WebSocket::s_openSocketCount >= WS_MAX_SOCKETS) {
 printf("Cannot accept new connection: limit reached (%d)\n",
 WS_MAX_SOCKETS);
 return false;
 }

 printf("Can accept connection (%d/%d slots used)\n",
 WebSocket::s_openSocketCount, WS_MAX_SOCKETS);
 return true;
}
```

##### Resource Monitoring

```
void MonitorWebSocketResources() {
 int used = WebSocket::s_openSocketCount;
 int available = WS_MAX_SOCKETS - used;
 float usage_percent = (used * 100.0f) / WS_MAX_SOCKETS;

 printf("WebSocket Resource Usage:\n");
 printf(" Used: %d\n", used);
 printf(" Available: %d\n", available);
 printf(" Usage: %.1f%%\n", usage_percent);

 if (usage_percent > 80.0f) {
 printf(" WARNING: High resource usage!\n");
 }
}
```

##### Connection Acceptance Logic

```
int HandleNewWebSocketRequest(int tcp_fd) {
 // Check if we can accept more connections
 if (WebSocket::s_openSocketCount >= (WS_MAX_SOCKETS - 1)) {
 printf("Rejecting connection: only 1 slot remaining (reserved)\n");
 SendWebSocketError(tcp_fd, 503, "Service Unavailable");
 close(tcp_fd);
 return -1;
 }

 // Promote to WebSocket
```

```

 if (promote_tcp_ws(tcp_fd) == 0) {
 printf("Connection accepted (%d/%d)\n",
 WebSocket::s_openSocketCount, WS_MAX_SOCKS);
 return 0;
 }

 return -1;
}

```

### Periodic Status Reporting

```

void WebSocketStatusTask(void *pd) {
 while (1) {
 int count = WebSocket::s_openSocketCount;

 if (count > 0) {
 printf("[%lu] Active WebSocket connections: %d\n",
 Secs, count);
 }

 // Report every 60 seconds
 OSTimeDly(TICKS_PER_SECOND * 60);
 }
}

```

#### 16.190.43.4 socket\_crit

OS\_CRIT NB::WebSocket::socket\_crit

Critical section for thread-safe socket operations.

This member variable provides a critical section (mutual exclusion) mechanism to ensure thread-safe access to the [WebSocket](#)'s socket operations. In a multi-threaded RTOS environment, multiple tasks may attempt to read from, write to, or modify the same [WebSocket](#) connection simultaneously, which could lead to data corruption or protocol violations.

The critical section protects:

- Socket read and write operations
- Buffer access and manipulation
- State changes and transitions
- Socket option modifications
- Connection establishment and closure

Usage pattern:

1. Enter critical section before socket operations
2. Perform socket operations
3. Exit critical section after operations complete

NetBurner RTOS provides OS\_CRIT primitives for critical sections:

- USER\_ENTER\_CRITICAL(): Enter critical section (acquire lock)
- USER\_EXIT\_CRITICAL(): Exit critical section (release lock)

These operations disable task switching temporarily to ensure atomic execution of protected code sections. The critical section should be held for the minimum time necessary to avoid blocking other tasks.

#### Note

Critical sections should be kept as short as possible to minimize impact on system responsiveness.

Failing to properly enter/exit critical sections can lead to race conditions, data corruption, or deadlocks.

The OS\_CRIT type is typically a structure that tracks the critical section state and may include nesting counters.

## Warning

Never return from a function without exiting a critical section you entered. Always use balanced enter/exit calls.

Avoid performing blocking operations (delays, waits) inside critical sections as this defeats their purpose and can cause system performance issues.

## Expand for Example Usage

### Examples

#### Protected Write Operation

```
int SafeWrite(WebSocket *ws, const char *data, int length) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 // Protected: Write operation is atomic
 int bytes_written = write(ws->m_fd_tcp, data, length);

 USER_EXIT_CRITICAL(&ws->socket_crit);

 return bytes_written;
}
```

#### Protected Read Operation

```
int SafeRead(WebSocket *ws, char *buffer, int size) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 // Protected: Read operation is atomic
 int bytes_read = read(ws->m_fd_tcp, buffer, size);

 USER_EXIT_CRITICAL(&ws->socket_crit);

 return bytes_read;
}
```

#### Protected State Change

```
void SetConnectionState(WebSocket *ws, WS_State new_state) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 // Protected: State change is atomic
 WS_State old_state = ws->m_state;
 ws->m_state = new_state;

 USER_EXIT_CRITICAL(&ws->socket_crit);

 printf("State changed: %d -> %d\n", old_state, new_state);
}
```

#### Protected Buffer Access

```
int GetBufferStats(WebSocket *ws, int *bytes_available, int *space_free) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 // Protected: Buffer state reads are consistent
 *bytes_available = ws->rxBuffer.BytesAvail();
 *space_free = ws->txBuffer.SpaceAvail();

 USER_EXIT_CRITICAL(&ws->socket_crit);

 return 0;
}
```

### Error Handling in Critical Section

```
int SafeOperation(WebSocket *ws, const char *data, int length) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 int result = -1;

 if (ws->m_fd_tcp >= 0) {
 result = write(ws->m_fd_tcp, data, length);

 if (result < 0) {
 // Handle error inside critical section
 ws->m_state = WS_STATE_ERROR;
 }
 }

 USER_EXIT_CRITICAL(&ws->socket_crit);

 return result;
}
```

### Nested Critical Section (if supported)

```
void ComplexOperation(WebSocket *ws) {
 USER_ENTER_CRITICAL(&ws->socket_crit);

 // First operation
 UpdateInternalState(ws);

 // Nested critical section (if OS_CRIT supports nesting)
 USER_ENTER_CRITICAL(&ws->socket_crit);
 UpdateSocketOptions(ws);
 USER_EXIT_CRITICAL(&ws->socket_crit);

 // Second operation
 FlushBuffers(ws);

 USER_EXIT_CRITICAL(&ws->socket_crit);
}
```

### Multiple Task Access Pattern

```
// Task 1: Writing to WebSocket
void WriterTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;

 while (1) {
 char data[64];
 GenerateData(data, sizeof(data));

 USER_ENTER_CRITICAL(&ws->socket_crit);
 ws->WriteData(data, sizeof(data));
 USER_EXIT_CRITICAL(&ws->socket_crit);

 OSTimeDly(TICKS_PER_SECOND);
 }
}

// Task 2: Reading from WebSocket
void ReaderTask(void *pd) {
 WebSocket *ws = (WebSocket *)pd;

 while (1) {
 char buffer[256];

 USER_ENTER_CRITICAL(&ws->socket_crit);
 int bytes = ws->ReadData(buffer, sizeof(buffer));
 USER_EXIT_CRITICAL(&ws->socket_crit);

 if (bytes > 0) {
 ProcessData(buffer, bytes);
 }

 OSTimeDly(TICKS_PER_SECOND / 10);
 }
}
```

### Critical Section Timing Measurement

```
void MeasureCriticalSectionTime(WebSocket *ws) {
 uint32_t start_tick = TimeTick;

 USER_ENTER_CRITICAL(&ws->socket_crit);

 // Perform operation
```

```

PerformSocketOperation(ws);

uint32_t end_tick = TimeTick;
USER_EXIT_CRITICAL(&ws->socket_crit);

uint32_t duration_ticks = end_tick - start_tick;
float duration_us = (duration_ticks * 1000000.0f) / TICKS_PER_SECOND;

printf("Critical section held for %.2f microseconds\n", duration_us);

if (duration_us > 1000.0f) {
 printf("WARNING: Critical section held too long!\n");
}
}

```

### Conditional Critical Section

```

void ConditionalProtectedOperation(WebSocket *ws, bool needs_protection) {
 if (needs_protection) {
 USER_ENTER_CRITICAL(&ws->socket_crit);
 }

 // Operation that may or may not need protection
 PerformOperation(ws);

 if (needs_protection) {
 USER_EXIT_CRITICAL(&ws->socket_crit);
 }
}

```

### Diagnostic: Check Critical Section Status

```

void DiagnoseCriticalSection(WebSocket *ws) {
 // Note: This is conceptual - actual implementation depends on OS_CRIT structure
 printf("Critical Section Diagnostics:\n");
 printf(" Address: %p\n", &ws->socket_crit);

 // If OS_CRIT has a lock counter or owner field:
 // printf(" Lock count: %d\n", ws->socket_crit.lock_count);
 // printf(" Owner task: %d\n", ws->socket_crit.owner_task);
}

```

## 16.190.43.5 WSSockStructs

`WebSocket` NB: `WebSocket::WSSockStructs[WS_MAX_SOCKS]` [static]

Static array of `WebSocket` connection structures.

This static array holds all `WebSocket` connection structures, providing storage for up to `WS_MAX_SOCKS` concurrent `WebSocket` connections. Each element represents a potential `WebSocket` connection slot.

The array is pre-allocated at compile time, eliminating the need for dynamic memory allocation during runtime. This approach:

- Provides predictable memory usage
- Eliminates allocation failures
- Improves performance by avoiding heap operations
- Simplifies resource management

When a new `WebSocket` connection is established, an unused slot in this array is assigned. When a connection closes, its slot becomes available for reuse.

#### Note

This is a static array shared across all `WebSocket` operations. Individual elements are accessed via helper functions like `GetWebSocketRecord()`.

#### See also

`WS_MAX_SOCKS` for the array size

`s_openSocketCount` for tracking active connections

`GetWebSocketRecord()` for finding `WebSocket` by file descriptor

## Example Usage

### Expand for Example Usage

#### Examples Iterate All WebSocket Slots

```
void DisplayAllWebSockets() {
 printf("WebSocket Connection List:\n");
 printf("=====\n");

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->IsActive()) {
 printf("[%d] fd=%d, state=%d\n",
 i, ws->GetFd(), ws->GetState());
 }
 }
}
```

#### Find Available Slot

```
WebSocket* FindAvailableWebSocketSlot() {
 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (!ws->IsActive()) {
 printf("Found available slot: %d\n", i);
 return ws;
 }
 }

 printf("No available WebSocket slots\n");
 return nullptr;
}
```

#### Close All Active Connections

```
void CloseAllWebSockets() {
 int closed_count = 0;

 printf("Closing all WebSocket connections...\n");

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->IsActive()) {
 int fd = ws->GetFd();
 ws_externalclose(fd);
 closed_count++;
 printf(" Closed slot %d (fd %d)\n", i, fd);
 }
 }

 printf("Closed %d WebSocket connections\n", closed_count);
}
```

#### Collect Connection Statistics

```
void CollectWebSocketStatistics() {
 int active = 0;
 int inactive = 0;
 uint32_t total_bytes_sent = 0;
 uint32_t total_bytes_received = 0;

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSSockStructs[i];

 if (ws->IsActive()) {
 active++;
 total_bytes_sent += ws->GetBytesSent();
 total_bytes_received += ws->GetBytesReceived();
 } else {
 inactive++;
 }
 }

 printf("WebSocket Statistics:\n");
 printf(" Active connections: %d\n", active);
 printf(" Inactive slots: %d\n", inactive);
 printf(" Total bytes sent: %lu\n", total_bytes_sent);
 printf(" Total bytes received: %lu\n", total_bytes_received);
}
```

### Broadcast to All Active Connections

```
void BroadcastToAllWebSockets(const char *message) {
 int length = strlen(message);
 int sent_count = 0;

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSocketStructs[i];

 if (ws->IsActive()) {
 int fd = ws->GetFd();
 int bytes_written = ws_write(fd, message, length);

 if (bytes_written > 0) {
 ws_flush(fd);
 sent_count++;
 }
 }
 }

 printf("Broadcast sent to %d WebSocket(s)\n", sent_count);
}
```

### Find Idle Connections

```
void CloseIdleConnections(uint32_t max_idle_seconds) {
 uint32_t current_time = Secs;

 for (int i = 0; i < WS_MAX_SOCKETS; i++) {
 WebSocket *ws = &WebSocket::WSocketStructs[i];

 if (ws->IsActive()) {
 uint32_t idle_time = current_time - ws->GetLastActivityTime();

 if (idle_time > max_idle_seconds) {
 int fd = ws->GetFd();
 printf("Closing idle connection slot %d (idle %lu sec)\n",
 i, idle_time);
 ws_externalclose(fd);
 }
 }
 }
}
```

## 16.191 wifi\_init Struct Reference

```
#include <wifiDriver.h>
```

### 16.191.1 Detailed Description

This structure is used as a WiFi initialization structure for defining pins, IRQ, and type of WiFi module being used with a specific bus type. the GetDriver function pointer must be defined to one of the supported WiFi module option's static driver function. The options are GetNewWicedSPIDriver(), GetNewWicedSerialDriver(), or GetNewWicedWilcDriver(). Default WifiInit structures are defined using macros for each of the NBWIFI development kit options. If the user is using pin/IRQ settings that differ from the default values, the user must either define their own wifiInit structure in their project or pass in the custom values to the WiFi initialization functions as parameters.

The documentation for this struct was generated from the following file:

- wifiDriver.h

## 16.192 WifiInterface Class Reference

## 16.193 WireIntf Class Reference

Wire Interface Class for [I2C](#).

```
#include <i2c.h>
```

### Public Member Functions

- void **begin** ()  
*Initialize the [WireIntf](#) driver object as a master with a bus speed of 100 kHz. This normally only needs to be called once.*
- uint32\_t **requestFrom** (uint8\_t addr, uint32\_t len, bool stop=true)  
*Request a number of bytes from a slave device. The bytes can then be retrieved from the slave device with the [read\(\)](#) and [available\(\)](#) functions.*
- void **beginTransmission** (uint8\_t addr)  
*Begin a transmission to a [I2C](#) slave device at the provided address. Bytes can be queued for transmission with the [write\(\)](#) functions, and are transmitted by calling [endTransmission\(\)](#).*
- void **endTransmission** (bool stop=true)  
*Transmits the bytes of data queued by using the [write\(\)](#) functions, and ends a transmission to a slave device that was started using [beginTransmission\(\)](#).*
- uint32\_t **write** (uint8\_t dat)  
*Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransmission\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.*
- uint32\_t **write** (char \*str)  
*Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransmission\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.*
- uint32\_t **write** (uint8\_t \*buf, uint32\_t len)  
*Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransmission\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.*
- uint32\_t **available** ()  
*Get the number of bytes available to be read from the slave device with [read\(\)](#). This function can be called after a call to [requestFrom\(\)](#).*
- uint8\_t **read** ()  
*Reads a byte of data that was transmitted from a slave [I2C](#) device after a call to [requestFrom\(\)](#).*
- void **flush** (bool bIssueStop=false)  
*Force the data that were queued to be transmitted using the [write\(\)](#) functions to be transmitted on the [I2C](#) bus.*

### 16.193.1 Detailed Description

Wire Interface Class for [I2C](#).

For [I2C](#) communication, you can choose the [WireIntf](#) class, or the [I2C](#) class. The [WireIntf](#) class is simpler to use, while the [I2C](#) class provides more low level control.

Note that the system automatically instantiates [I2C](#) and [WireIntf](#) objects for each of the [I2C](#) peripheral modules. The [WireIntf](#) objects can be accessed with: Wire, Wire1 and Wire2. The [I2C](#) objects can be accessed with [I2C\[0\]](#), [I2C\[1\]](#) and [I2C\[2\]](#).

### 16.193.2 Member Function Documentation

#### 16.193.2.1 available()

```
uint32_t WireIntf::available ()
```

Get the number of bytes available to be read from the slave device with [read\(\)](#). This function can be called after a call to [requestFrom\(\)](#).

**Returns**

The number of bytes available for reading from the slave device.

**16.193.2.2 beginTransmission()**

```
void WireIntf::beginTransmission (
 uint8_t addr)
```

Begin a transmission to a [I2C](#) slave device at the provided address. Bytes can be queued for transmission with the [write\(\)](#) functions, and are transmitted by calling [endTransmission\(\)](#).

**Parameters**

|             |                                                |
|-------------|------------------------------------------------|
| <i>addr</i> | the address of the device to transmit data to. |
|-------------|------------------------------------------------|

**16.193.2.3 endTransmission()**

```
void WireIntf::endTransmission (
 bool stop = true)
```

Transmits the bytes of data queued by using the [write\(\)](#) functions, and ends a transmission to a slave device that was started using [beginTransmission\(\)](#).

**Parameters**

|             |                                                                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>stop</i> | If true, sends a stop message after the request, releasing the <a href="#">I2C</a> bus. If false, the driver will send a restart request, keeping the connection alive. This prevents other <a href="#">I2C</a> master devices from transmitting between messages. This allows one master to transmit multiple transmissions uninterrupted. |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**16.193.2.4 flush()**

```
void WireIntf::flush (
 bool bIssueStop = false)
```

Force the data that were queued to be transmitted using the [write\(\)](#) functions to be transmitted on the [I2C](#) bus. If you need to know exactly when a transaction will occur, call [flush\(\)](#). If accessing a register, be sure to write all address bytes before the call.

**Parameters**

|                   |                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>bIssueStop</i> | If true, sends a stop message after the request, releasing the <a href="#">I2C</a> bus. If false, the driver will send a restart request, keeping the connection alive. This prevents other <a href="#">I2C</a> master devices from transmitting between messages. This allows one master to transmit multiple transmissions uninterrupted. |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**16.193.2.5 read()**

```
uint8_t WireIntf::read ()
```

Reads a byte of data that was transmitted from a slave [I2C](#) device after a call to [requestFrom\(\)](#).

**Returns**

The byte of data received from the slave [I2C](#) device.

### 16.193.2.6 requestFrom()

```
uint32_t WireIntf::requestFrom (
 uint8_t addr,
 uint32_t len,
 bool stop = true)
```

Request a number of bytes from a slave device. The bytes can then be retrieved from the slave device with the [read\(\)](#) and [available\(\)](#) functions.

#### Parameters

|             |                                                                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>addr</i> | the address of the slave to request data from.                                                                                                                                                                                                                                                                                              |
| <i>len</i>  | the number of bytes to request from the slave.                                                                                                                                                                                                                                                                                              |
| <i>stop</i> | If true, sends a stop message after the request, releasing the <a href="#">I2C</a> bus. If false, the driver will send a restart request, keeping the connection alive. This prevents other <a href="#">I2C</a> master devices from transmitting between messages. This allows one master to transmit multiple transmissions uninterrupted. |

#### Returns

The number of bytes returned from the slave [I2C](#) device.

### 16.193.2.7 write() [1/3]

```
uint32_t WireIntf::write (
 char * str)
```

Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransaction\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.

#### Parameters

|            |                                                                                |
|------------|--------------------------------------------------------------------------------|
| <i>str</i> | A string to send as a series of bytes to the <a href="#">I2C</a> slave device. |
|------------|--------------------------------------------------------------------------------|

#### Returns

The number of of bytes written to the transmit queue buffer.

### 16.193.2.8 write() [2/3]

```
uint32_t WireIntf::write (
 uint8_t * buf,
 uint32_t len)
```

Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransaction\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.

#### Parameters

|            |                                                                            |
|------------|----------------------------------------------------------------------------|
| <i>buf</i> | An array of data to send as bytes to the <a href="#">I2C</a> slave device. |
| <i>len</i> | The number of bytes to be written from the buf parameter.                  |

#### Returns

The number of of bytes written to the transmit queue buffer.

**16.193.2.9 write() [3/3]**

```
uint32_t WireIntf::write (
 uint8_t dat)
```

Queues bytes of data to be transmitted to the slave device. This function can be called after a call to [beginTransaction\(\)](#). The data will not be transmitted on the [I2C](#) bus until a call to [endTransmission\(\)](#) or [flush\(\)](#) is performed.

**Parameters**

|            |                                                                           |
|------------|---------------------------------------------------------------------------|
| <i>dat</i> | A byte of data to be transmitted to the <a href="#">I2C</a> slave device. |
|------------|---------------------------------------------------------------------------|

**Returns**

The number of of bytes written to the transmit queue buffer.

### 16.194.1 Detailed Description

[WM8904](#) is a driver for the [WM8904](#) Audio Codec.

### 16.194.2 Constructor & Destructor Documentation

#### 16.194.2.1 WM8904()

```
WM8904::WM8904 (
 I2C & module)
```

The constructor for the [WM8904](#) context.

##### Parameters

|               |                                                                                     |
|---------------|-------------------------------------------------------------------------------------|
| <i>module</i> | A reference to the <a href="#">I2C</a> module to be used for configuring the codec. |
|---------------|-------------------------------------------------------------------------------------|

### 16.194.3 Member Function Documentation

#### 16.194.3.1 GetMicGain()

```
uint8_t WM8904::GetMicGain (
 AudioChSelect_t channel)
```

Get the microphone gain of the selected input channel.

##### Parameters

|                |                          |
|----------------|--------------------------|
| <i>channel</i> | Input Channel to select. |
|----------------|--------------------------|

##### Returns

Gain the channel is set to.

#### 16.194.3.2 GetVolume()

```
uint8_t WM8904::GetVolume (
 AudioOutSelect_t out,
 AudioChSelect_t channel)
```

Get the volume of the selected audio output and channel.

##### Parameters

|                |                           |
|----------------|---------------------------|
| <i>out</i>     | Audio Output to select.   |
| <i>channel</i> | Output Channel to select. |

**Returns**

Volume the channel is set to.

**16.194.3.3 Init()**

```
void WM8904::Init (
 const cfg_t & cfg,
 const SSC_cfg_t & ssc_cfg)
```

Configures and initializes both the driver and the codec.

**Parameters**

|                |                                      |
|----------------|--------------------------------------|
| <i>cfg</i>     | The driver configuration to use.     |
| <i>ssc_cfg</i> | The SSC driver configuration to use. |

**16.194.3.4 Mute()**

```
void WM8904::Mute (
 AudioOutSelect_t out,
 AudioChSelect_t channel,
 bool mute)
```

Mute or unmute the selected audio output and channel.

**Parameters**

|                |                                     |
|----------------|-------------------------------------|
| <i>out</i>     | Audio Output to select.             |
| <i>channel</i> | Output Channel to select.           |
| <i>mute</i>    | Whether the channel is to be muted. |

**16.194.3.5 MuteMic()**

```
void WM8904::MuteMic (
 AudioChSelect_t channel,
 bool mute)
```

Mute or unmute the selected input channel.

**Parameters**

|                |                                     |
|----------------|-------------------------------------|
| <i>channel</i> | Input Channel to select.            |
| <i>mute</i>    | Whether the channel is to be muted. |

**16.194.3.6 ReadReg()**

```
uint16_t WM8904::ReadReg (
 Reg::RegAddr_t reg)
```

Read a register on the [WM8904](#).

**Parameters**

|            |                    |
|------------|--------------------|
| <i>reg</i> | Register to write. |
|------------|--------------------|

**Returns**

Data read.

**16.194.3.7 ReadyReceiveBuffer()**

```
int WM8904::ReadyReceiveBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded)
```

Hands off a buffer to be written to by the codec.

**Parameters**

|                     |                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>       | A pointer to the buffer to be written to.                                                                   |
| <i>bufferLen</i>    | The length of the buffer to be written. (Must be multiples of 1, 2, or 4 bytes depending on word bit width) |
| <i>waitIfNeeded</i> | Whether the driver should wait for space to receive or fail immediately upon exhausting the queue depth.    |

**Returns**

Negative on failure.

**16.194.3.8 SendCmd()**

```
void WM8904::SendCmd (
 Reg::cmd_t cmd)
```

Execute codec Command. A command is: a register to write, a value to write, and a delay of time required for command execution.

**Parameters**

|            |                    |
|------------|--------------------|
| <i>cmd</i> | Command to execute |
|------------|--------------------|

**16.194.3.9 SendCmdList()**

```
void WM8904::SendCmdList (
 Reg::cmd_t * cmds,
 uint32_t len)
```

Execute an array of codec Commands. A command is: a register to write, a value to write, and a delay of time required for command execution.

**Parameters**

|             |                                |
|-------------|--------------------------------|
| <i>cmds</i> | Commands to execute            |
| <i>len</i>  | Number of commands to execute. |

**16.194.3.10 SetMicGain()**

```
void WM8904::SetMicGain (
 WM8904::AudioChSelect_t channel,
 uint8_t gain)
```

Set the microphone gain of the selected input channel.

**Parameters**

|                |                          |
|----------------|--------------------------|
| <i>channel</i> | Input Channel to select. |
| <i>gain</i>    | Gain to set channel to.  |

#### 16.194.3.11 SetVolume()

```
void WM8904::SetVolume (
 WM8904::AudioOutSelect_t out,
 WM8904::AudioChSelect_t channel,
 uint8_t volume)
```

Set the volume of the selected audio output and channel.

##### Parameters

|                |                           |
|----------------|---------------------------|
| <i>out</i>     | Audio Output to select.   |
| <i>channel</i> | Output Channel to select. |
| <i>volume</i>  | Volume to set channel to. |

#### 16.194.3.12 TransmitBuffer()

```
int WM8904::TransmitBuffer (
 void * buffer,
 uint32_t bufferLen,
 bool waitIfNeeded)
```

Hands off a buffer to be transmitted to the codec.

##### Parameters

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>       | A pointer to the buffer to be transmit.                                                                      |
| <i>bufferLen</i>    | The length of the buffer to be transmit. (Must be multiples of 1, 2, or 4 bytes depending on word bit width) |
| <i>waitIfNeeded</i> | Whether the driver should wait for space to transmit or fail immediately upon exhausting the queue depth.    |

##### Returns

Negative on failure.

#### 16.194.3.13 UpdateCmd()

```
void WM8904::UpdateCmd (
 Reg::cmd_t cmd,
 uint16_t updateMask)
```

Execute a codec Command to update a register. A command is: a register to write, a value to write, and a delay of time required for command execution.

##### Parameters

|                   |                                                              |
|-------------------|--------------------------------------------------------------|
| <i>cmd</i>        | Command to execute                                           |
| <i>updateMask</i> | A Positive bit mask of bits to update in the target register |

#### 16.194.3.14 WriteReg()

```
void WM8904::WriteReg (
 Reg::RegAddr_t reg,
 uint16_t dat)
```

Write a register on the [WM8904](#).

**Parameters**

|            |                    |
|------------|--------------------|
| <i>reg</i> | Register to write. |
| <i>dat</i> | Data to write.     |

## 16.195 fifo\_buffer\_storage::WriteBufPtr Class Reference

RAII accessor for writing to buffer storage.

```
#include <buffers.h>
```

### 16.195.1 Detailed Description

RAII accessor for writing to buffer storage.

Provides safe access to internal buffer write pointer with automatic locking and cleanup. Not IRQ safe.

The documentation for this class was generated from the following file:

- buffers.h
